## 0 Basic Definitions and Lemmas

**Definition 0.1.** A **CW-complex** is a space constructed by successively attaching cells:

For  $n \in \mathbb{N}$ ,  $n \ge 0$ , there are maps  $\{\varphi_i : S^{n-1} \to X^{n-1}\}_{i \in I_n}$  (called characteristic maps). The way to construct  $X^n$  (called *n*-skeleton of X) is :

(starting from  $X^{-1} = \emptyset$ , if we start from  $X^{-1} = A$ , we say (X, A) is a **relative CW-complex**)

$$\coprod_{i \in I_n} S^{n-1} \xrightarrow{\coprod_{i \in I_n} \varphi_i} X^{n-1}$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow \qquad (pushout)$$

$$\coprod_{i \in I_n} D^n \xrightarrow{\qquad \qquad } X^n$$

and the resulting CW-complex X is  $\varinjlim \{X^0 \to \cdots \to X^n \to X^{n+1} \to \cdots \}$ . The images of  $\overset{\circ}{D_i^n}$  in X is called open cell  $e_i^n$  of X.

**Definition 0.2.** A is a subcomplex of CW-complex X iff for any open cell  $e_i^n$  of X, A satisfy:  $A \cap e_i^n \neq \emptyset \implies e_i^{\bar{n}} \subseteq A$ .

Pair of X and subcomplex A:(X,A) is called a CW-pair.

**Definition 0.3.** The Infinite Symmetric Product of a pointed space  $(X, x_0)$  is colimit of its n-th Symmetric Products ( $SP^n X := (\prod_{\{0,1,\ldots,n-1\}} X)/S_n$ ):

$$\varinjlim \{ \cdots \hookrightarrow \operatorname{SP}^n X \hookrightarrow \operatorname{SP}^{n+1} X \hookrightarrow \cdots \}$$
$$\{x_1, \dots, x_n\} \mapsto \{x_0, x_1, \dots, x_n\}$$

**Definition 0.4.** For  $n \ge 1$ , a map between pairs  $f: (X, A) \to (Y, B)$  is an *n*-equivalence if:

- $f_*^{-1}(\operatorname{Im}(\pi_0 B \to \pi_0 Y)) = \operatorname{Im}(\pi_0 A \to \pi_0 X)$
- For all choices of basepoint a in A,

$$f_*: \pi_q(X, A, a) \to \pi_q(Y, B, f(a))$$

is isomorphism for  $1 \le q \le n-1$  and epimorphism for q=n.

**Definition 0.5.** A pair (X, A) of topological spaces is n-connected if  $\pi_0(A) \to \pi_0(X)$  is surjection and  $\pi_q(X, A) = 0$  for  $1 \le q \le n$ .

**Definition 0.6.** For topological spaces  $A \hookrightarrow X$ , A is a **strong deformation retract** of a neighborhood V in X if:

 $\exists h: V \times I \to X \text{ such that}$ 

 $\forall x \in V, \ h(x,0) = x$ 

 $h(V,1) \subseteq A$ 

 $\forall (a,t) \in A \times I, \ h(a,t) = a$ 

**Definition 0.7.** For topological spaces  $i: A \hookrightarrow X$ , A is a **deformation retract** of X if:

 $\exists h: X \times I \to X \text{ such that}$ 

 $\forall x \in X, \ h(x,0) = x$ 

h(X,1) = A

 $\forall (a,t) \in A \times I, \ h(a,t) = a$ 

(That is, there are retraction  $r: X \to A$  and homotopy  $h: \mathrm{id}_X \simeq i \circ r \mathrm{rel} A$ )

And r := h(-,1) is called a **deformation retraction**.

**Definition 0.8.** For topological spaces  $A \hookrightarrow X$ , a neighborhood V of A is **deformable** to A if:  $\exists h: X \times I \to X$  such that

 $\forall x \in X, \ h(x,0) = x$ 

 $h(A \times I) \subseteq A, h(V \times I) \subseteq V.$ 

 $h(V,1) \subseteq A$ 

**Definition 0.9.** For a topological group G, a **relative** G-(**equivariant) CW-complex** (X, A) is a space constructed by successively attaching G-equivariant cells  $G/H \times D^n$  on a G-space A: For  $n \in \mathbb{N}, n \geq 0$ , there are maps  $\{\varphi_i : G/H_i \times S^{n-1} \to X^{n-1}\}_{i \in I_n}$  (called characteristic maps) where each  $H_i$  is closed subgroup of G and G acts trivially on  $D^n$ ,  $S^{n-1}$ . The way to construct  $X^n$  (called G-skeleton of G) is:

(starting from  $X^{-1} = A$  where A is an G-space)

The resulting X is  $\varinjlim \{X^{-1} \to X^0 \to \cdots \to X^n \to X^{n+1} \to \cdots \}$ . The images of  $G/H_i \times \overset{\circ}{D_i^n}$  in X is called open n-cell of type  $G/H_i$ .  $\phi_i$  is called the attaching map and  $\varphi_i(G/H_i \times S^{n-1})$  is called the boundary of  $\phi_i(G/H_i \times D^n)$ . If  $A = \emptyset$ , then X is called a G-(equivariant) CW-complex.

A criterion of weak homotopy equivalence:

**Lemma 0.1.** The following on a map  $e: Y \to Z$  and any fixed  $n \in \mathbb{N}$  are equivalent:

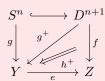

- 1. For any  $y \in Y$  ,  $e_*: \pi_q(Y,y) \to \pi_q(Z,e(y))$  is monomorphism for q=n and is epimorphism for q=n+1.
- 2. (HELP of  $(D^{n+1}, S^n)$ ) Given maps  $f: D^{n+1} \to Z$ ,  $g: S^n \to Y$  and homotopy  $h: f \circ i \simeq e \circ g$ :

$$S^{n} \stackrel{i}{\longleftarrow} D^{n+1}$$

$$\downarrow g \qquad \qquad \downarrow f$$

$$Y \stackrel{e}{\longrightarrow} Z$$

then we have extension  $g^+:D^{n+1}\to Y$  of g and  $h^+:f\simeq e\circ g^+$ :

3. Conclusion above holds when the given h is  $id_{f \circ i}$ .

**Proof.** Trivially 2. implies 3.

Our first goal: 3. implies 1.

Fix  $n \in \mathbb{N}$ .  $\pi_n(e)$  is monomorphism:

For n = 0, 3. says if we have path  $e(y) \simeq e(y')$  then we have path  $y \simeq y'$ . That is to say e can not map two path-connected component to one.

For n > 0, 3. says if  $e \circ g$  is nullhomotopic, then  $g: S^n \to Y$  could be extend to  $g^+: D^{n+1} \to Y$ , which can be used to construct nullhomotopy of g.

Fix  $n \in \mathbb{N}$ .  $\pi_{n+1}(e)$  is epimorphism:

For  $[f] \in \pi_{n+1}(Z, e(y)) \cong [D^{n+1}, S^n; Z, e(y)]$ , let  $g := s \mapsto y$ , the extension  $g^+$  satisfy  $e_*([g^+]) = [f]$ , that proves  $e_*$  is epimorphism.

Second goal: 1. implies 2.

Fix g, f, h in the condition of 2. first. And observe that  $\pi_n(Y, y) = [S^n, *; Y, y], \pi_{n+1}(Y, y) = [D^{n+1}, S^n; Y, y].$ 

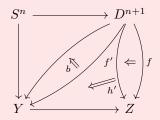

There is a map  $f':(D^{n+1},S^n)\to Z$  homotopic to f defined by  $f'=f\circ b(-,1)$  where

$$\begin{aligned} b: CS^n \times I \to CS^n \\ (\overline{(x,t)},s) \mapsto \begin{cases} \overline{(x,1-2t)} & t \leq \frac{s}{2} \\ \overline{(x,\frac{t-s/2}{1-s/2})} & t \geq \frac{s}{2} \end{cases} \end{aligned}$$

(recall that  $D^{n+1} \simeq CS^n$ ) Therefore we can replace f with f'. Using the epimorphism leads to  $h': e \circ g^{+'} \simeq f'$ , using the monomorphism leads to  $r: g^{+'} \circ i \simeq g$ . Construct  $g^+:=a(-,1)$  using

$$\begin{aligned} a: CS^n \times I &\to Z \\ (\overline{(x,t)},s) &\mapsto \begin{cases} r(x,s-2t) & t \leq \frac{s}{2} \\ g^{+'}(x,\frac{t-s/2}{1-s/2}) & t \geq \frac{s}{2} \end{cases} \end{aligned}$$

And that is the end of the proof:

# 1 Right Notion For Spaces

**Theorem 1.1.** Homotopy Extension and Lifting property:

A: a topological space

X: result of successively attaching cells on A of dimensions  $0, 1, \ldots, k$   $(k \le n)$ 

 $e: Y \rightarrow Z: n$ -equivalence

 $g:A\to Y,\ f:X\to Z$ 

 $h: f|_A \simeq e \circ g$ 

$$\begin{array}{c|c} A & \longleftarrow & X \\ g & & \downarrow f \\ Y & \stackrel{e}{\longrightarrow} Z \end{array}$$

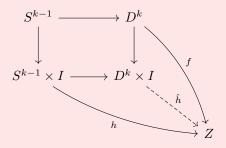

Then there exists  $g^+: X \to Y$  extends g  $(g^+|_A = g)$  and  $h^+: X \times I \to Z$  extends  $h, h^+: f \simeq e \circ g^+$ 

$$A \hookrightarrow X$$

$$g \downarrow g^+ \downarrow f$$

$$Y \xrightarrow{e} Z$$

**Proof.** It suffices to prove the case  $A = S^{k-1}, X = D^k$ , e is inclusion. (replace Z by  $M_e$ ) Apply HEP of  $(D^k, S^{k-1})$ :

 $f':=\hat{h}(-,1)$ , replace f with f' the diagram would be strictly commute. Therefore, f' is map of pairs  $(D^k,S^{k-1})\to (Z,Y),\ k\le n$  implies f' is nullhomotopic, suppose  $h^+:D^k\times I\to Z$  is the nullhomotopy, then  $g^+:=h^+(-,1)$  satisfy  $g^+(D^k)\subseteq Y$ .

*Note.* In HELP, at condition Y = Z and e = id, HELP says (X, A) have HEP

#### Corollary 1.2. If

 $A: a\ topological\ space$ 

 $X: result \ of \ successively \ attaching \ cells \ on \ A \ of \ any \ dimensions$ 

Then, (X, A) have HEP.

**Theorem 1.3.** If X is an CW-complex,  $e: Y \to Z$  is an n-equivalence, Then  $e_*: [X,Y] \to [X,Z]$  is a bijection if dim X < n, and a surjection if dim X = n. (Also valid for pointed case)

#### **Proof.** Surjectivity:

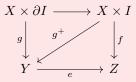

Apply HELP of  $(X, \emptyset)$   $((X, x_0)$  for pointed case) to obtain  $e_*[g^+] \simeq [f]$ :

Injectivity  $(\dim X < n)$ :

Suppose  $[g_0], [g_1] \in [X, Y], e_*[g_0] = e_*[g_1].$ 

Let  $f: e \circ g_0 \simeq e \circ g_1$  Apply HELP to  $(X \times I, X \times \partial I)$ :

**Corollary 1.4.** If X is a CW-complex,  $e: Y \to Z$  is weak homotopy equivalence, then  $e_*: [X,Y] \to [X,Z]$  is bijection.

#### 1.1 CW-approximation

This subsection shows that CW-complexes encode all weak-homotopy types of **TOP**.

**Definition 1.1.** A CW-approximation of  $(X, A) \in \mathbf{Top}(2)$  is a CW-pair  $(\widetilde{X}, \widetilde{A})$  and a weak homotopy equivalence of pairs  $\varphi : (\widetilde{X}, \widetilde{A}) \to (X, A)$ .

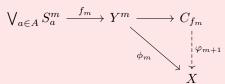

**Theorem 1.5.** (Existence of CW-approximation) If X is path-connected pointed space (0-connected), then there is a CW-approximation  $(\widetilde{X},*) \stackrel{\phi}{\to} (X,*)$ . If X is n-connected then  $\widetilde{X}$  could be chosen to satisfy  $\widetilde{X}^n = *$ . (Moreover, each characteristic map of X is pointed)

**Proof.** If X is n-connected, then  $\phi_n: Y^n:=*\to X$  is n-equivariance. Assume inductively that we already have m-equivalence  $Y^m \xrightarrow{\phi_m} X$   $(m \ge n)$ , Our goal is construct  $Y^{m+1}$  and  $\phi_{m+1}: Y^{m+1} \to X$ .

Let

$$f_m^+: \bigoplus_{a\in A} \mathbb{Z}_a \twoheadrightarrow \ker(\phi_{m*}) \subseteq \pi_m(Y^m)$$

be a free resolution of  $\ker(\phi_{m*})$  ( $\coprod_{a\in A} \mathbb{Z}_a$  if m=1), and obtain a (unique up to homotopy) map  $f_m:\bigvee_{a\in A} S_a^m\to Y^m$  defined by  $f_m|_{S_a^m}:=k_a$  where  $[k_a]=f_m^+(1_a)\in [S^m,Y^m]_*$ . We have: (since  $[\phi_m\circ f_m]=0$ )

 $C_{f_m}$  is a CW-complex with dim = n+1 with m-skeleton  $Y^m$ .  $\varphi_{m+1*}: \pi_m(C_{f_m}) \to \pi_m(X)$  is isomorphism, but  $\varphi_{m+1*}: \pi_{m+1}(C_{f_m}) \to \pi_{m+1}(X)$  is not necessarily an epimorphism. Define the set  $B:=\pi_{m+1}(X)-\varphi_{m+1*}(\pi_{m+1}(C_{f_m}))$  and  $Y^{m+1}:=C_{f_m}\vee (\bigvee_{b\in B}S_b^{m+1})$ . Define  $\phi^{m+1}$  by  $\phi^{m+1}|_{C_{f_m}}:=\varphi_{m+1}$  and  $\phi^{m+1}|_{S_b^{m+1}}:=r_b$  where  $[r_b]=b\in [S^{m+1},X]_*$ .

 $\widetilde{X} := \varinjlim_{m} \{Y^{0} \hookrightarrow \cdots \hookrightarrow Y^{m} \hookrightarrow Y^{m+1} \hookrightarrow \cdots \}, \text{ and } \phi = \varinjlim_{m} \phi_{m}$ 

If X is not path-connected, construct CW-approximation for each path-connected component.

*Note.* The proof of existence of CW-approximation uses homotopy excision theorem (CW-triad version). Proof of CW-traid version does not need CW-approximation. There is no circular argument.

**Proposition 1.6.** For any pair (X, A), there exists CW-approximation  $\phi : (\widetilde{X}, \widetilde{A}) \to (X, A)$ .

**Proof.** Construct  $\phi_A : \widetilde{A} \to A$  first and use analogue method in proof of theorem 1.5 with  $Y^0 := \widetilde{A}$ .

**Lemma 1.7.**  $\varphi, \psi$  are CW-approximations of  $X, Y, f: X \to Y$ , then

$$\begin{array}{ccc} \widetilde{X} & \stackrel{\varphi}{\longrightarrow} X \\ \exists \widetilde{f} & & \downarrow f \\ \widetilde{Y} & \stackrel{gh}{\longrightarrow} Y \end{array}$$

commutes up to homotopy, and  $\widetilde{f}$  is unique up to homotopy.

**Proof.** Directly from  $\psi_* : [\widetilde{X}, \widetilde{Y}] \to [\widetilde{X}, Y]$  is bijection.

**Theorem 1.8.**  $\varphi, \psi$  are CW-approximations of  $(X, A), (Y, B), f: (X, A) \to (Y, B),$  then

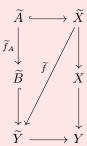

$$(\widetilde{X}, \widetilde{A}) \xrightarrow{\varphi} (X, A)$$

$$\exists \widetilde{f} \downarrow \qquad \qquad \downarrow f$$

$$(\widetilde{Y}, \widetilde{B}) \xrightarrow{\psi} (Y, B)$$

commutes up to homotopy, and  $\tilde{f}$  is unique up to homotopy.

**Proof.** Apply Lemma 1.7 to obtain map  $\widetilde{f}_A: \widetilde{A} \to \widetilde{B}$  and homotopy  $h: \psi|_{\widetilde{B}} \circ \widetilde{f}_A \simeq f \circ \varphi|_{\widetilde{A}}$  Use HELP of  $(\widetilde{X}, \widetilde{A})$  to extend it:

 $\psi_*$  is bijection implies the uniqueness up to homotopy of  $\widetilde{f}$ .

#### **Theorem 1.9.** (Whitehead's Theorem)

Every n-equivalence between CW-complexes whose dimension is lower than n, is homotopy equivalence. Every weak homotopy equivalence between CW-complexes is homotopy equivalence.

**Proof.**  $e: Y \to Z$  induce bijections  $[Y,Y] \to [Y,Z]$  and  $[Z,Y] \to [Z,Z]$ ,  $[f] = e_*^{-1}[\operatorname{id}_Z]$  implies  $[e \circ f] = [\operatorname{id}_Z]$  and  $[e \circ f \circ e] = [e]$  ( $[f \circ e] = e_*^{-1}[e] = [\operatorname{id}_Y]$ ).

Corollary 1.10. CW-approximation is unique up to homotopy.

**Example 1.1.** Polish circle (Warsaw circle): closed topologist's sine curve. It is n-connected for all n but not contractible.

**Definition 1.2.** A cellular map between CW-pairs is  $g:(X,A)\to (Y,B)$  such that  $g(A\cup X^n)\subseteq B\cup Y^n$ .

**Theorem 1.11.** For any map between CW-pairs  $f:(X,A)\to (Y,B)$  there exists a cellular map g such that  $g\simeq f$  rel A

**Proof.** Construct g inductively:

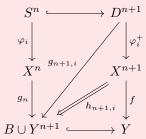

Start from  $A \cup X^0$ :

take paths  $\gamma_i: f(x_i) \simeq y_i$ , where  $y_i$  is any point in  $Y^0$  and  $x_i \in X^0 - A$ .

Construct  $h_0: (X^0 \cup A) \times I \to Y: h_0|_A(a,t) := f(a), h_0|_{X^0 - A}(x_i, t) := \gamma_i(t)$ . This is a homotopy from f to  $g_0 := h_0(-, 1): A \cup X^0 \to B \cup Y^0$ 

Inductive step:

Assume  $g_n: A \cup X^n \to B \cup Y^n$  and homotopy  $h_n: f|_{A \cup X^n} \simeq g_n$  is given, try to construct  $g_{n+1}$ : For each characteristic map  $\varphi_i: S^n \to X^n$ , take the resulting cell map  $\varphi_i^+: D^{n+1} \to X^{n+1}$  and use HELP of  $(D^{n+1}, S^n)$ :

Glue all  $g_{n+1,i}$  and  $h_{n+1,i}$  to produce  $g_{n+1}$  and  $h_{n+1}: f|_{A \cup X^{n+1}} \simeq g_{n+1}$ .

Final stage:

Maps  $g_n$  determine a cellular map  $g:X\to Y$  since X has the final topology determined by skeletons.

**Corollary 1.12.** If X is a pointed CW-complex, then the inclusions  $X^{n+1} \hookrightarrow X^{n+2} \hookrightarrow \cdots \hookrightarrow X$  induce  $\pi_n(X^{n+1}) \cong \pi_n(X^{n+2}) \cong \cdots \cong \pi_n(X)$ .

**Proof.** For  $k \geq 1$ ,  $X^{n+k} \hookrightarrow X^{n+k+1}$  induces epimorphism  $\pi_n(X^{n+k}) \twoheadrightarrow \pi_n(X^{n+k+1})$  since every  $f: (S^n, *) \to (X^{n+k+1}, *)$  is homotopic (rel \*) to an  $g: (S^n, *) \to (X^n, *) \hookrightarrow (X^{n+k}, *)$ . Now we want to prove it is monomorphism, that is,  $i_*[f] = 0 \Longrightarrow [f] = 0$  If  $h: (S^n, *) \times I \to X^{n+k+1}$  is a nullhomotopy in  $X^{n+k+1}$  of a map  $f: (S^n, *) \to (X^{n+k}, *) \hookrightarrow (X^{n+k+1}, *)$ , then  $h: (CS^n, S^n) \to (X^{n+k+1}, X^{n+k})$  is homotopic (rel  $S^n$ ) to an  $h': (CS^n, S^n) \to (X^{n+k}, X^{n+k})$ , which is equivalent to  $h': S^n \times I \to X^{n+k}$  with  $h(S^n, 1) = *, h(*, t) = *, h|_{S^n \times \{0\}} = f$ .

**Lemma 1.13.** If (X, A) is CW-pair and all cells of X - A have dim > n, then (X, A) is n-connected.

**Proof.** For each  $q \le n$ , and each  $[f] \in \pi_q(X, A)$ ,  $f \simeq g \operatorname{rel} S^{q-1}$  where g is an cellular map. (use theorem 1.11)  $\pi_q(X, A) \ni [g] = 0$  since  $g(S^{n-1} \cup e^n) = g(D^n) \subseteq A \cup X^n = A$ .

## 1.2 Operation of CW-complexes

We show that Product, Smash Product of CW-complexes and Quotient of CW-pairs (with compact-open topology) are CW-complexes. (Compact-open topology is the right topology on CW-complexes)

Product of CW-complexes:

**Example 1.2.** Product topology of two CW-complexes does not coincide with the final topology (union topology):

X (star of countably many edges) :  $X = X^1 = \bigvee_{n \in \omega} I_n$  Y (star of  $\omega^{\omega}$  many edges) :  $Y = Y^1 = \bigvee_{f \in \omega^{\omega}} I_f$  ( $(I_n, 0) \cong (I_f, 0) \cong (I, 0)$ ) Consider subset H of  $X \times Y$ :  $H := \{(\frac{1}{f(n)+1}, \frac{1}{f(n)+1}) \in I_n \times I_f \mid n \in \omega, f \in \omega^{\omega}\}.$ 

H is closed under the final topology since every cell of  $X \times Y$  contains at most one point of H. But closure of H contains (0,0) at product topology:

Let  $U \times V$  be an open neighborhood (at product topology) of (0,0), let  $g: \omega \to \omega - 0$  be an increasing function such that for all  $n \in \omega$ ,  $[0, \frac{1}{g(n)}) \subseteq U \cap I_n$ , let  $k \in omega$  be sufficiently large that  $\frac{1}{g(k)+1} \subseteq V \cap I_g$ , then  $(\frac{1}{g(k)+1}, \frac{1}{g(k)+1}) \in U \times V \cap H$ .

**Proposition 1.14.** X and Y are CW-complexes,  $X \times Y$  is CW-complex if X or Y is locally compact or

both X and Y have countably many cells.

Another way to realize  $X \times Y$  as CW-complex is to change its topology to the compactly generated topology  $k(X \times Y)$ :

**Definition 1.3.** For subspace A of X, A is compactly closed if

 $\forall$  compact space K  $\forall$  continuous  $g: K \to X$  $g^{-1}(A)$  is closed in K

**Definition 1.4.** X is k-space if any compactly closed subset is closed.

**Definition 1.5.** X is weak Hausdorff if

 $\forall \text{ compact space } K$   $\forall \text{ continuous } g:K\to X$  g(K) is closed in K

**Definition 1.6.** The k-ification of a space X is defined by:  $k(X) := (X, \tau)$  where  $\tau = \{X - A \mid A \text{ is compactly closed set}\}$ 

**Definition 1.7.** X is compactly generated space if it is k-space and weak Hausdorff.

*Note.* If X is weak Hausdorff, then  $A \subseteq X$  is compactly closed iff

$$\forall$$
 compact subspace  $K \subseteq X$   
 $A \cap K$  is closed in  $X$ 

If X is a CW-complex, then the topology defined on k(X) automatically coincide with the final topology induced by its CW-complex structure. We have CW-complex structure of  $k(X \times Y)$  is given by:

Furthermore, the k-ification is right adjoint of the inclusion functor i:

$$TOP_{\mathbf{CptGen}} \overset{i}{\underbrace{\qquad}} TOP_{\mathbf{weakHaus}}$$

This allows us to define the CW-complex structure on any limit of CW-complexes:  $\varprojlim_i X_i \approx \varprojlim_i k(X_i) \approx k(\varprojlim_i X_i)$  ( $X \approx k(X)$  and right adjoint preserve limits).

Note. Category of CW-complexes is not cartesian closed, but category of compactly generated spaces  $\mathbf{TOP_{CG}}$  is. And its pointed version  $\mathbf{TOP_{CG}^{*/}}$  have based exponential law:  $\mathrm{Hom}(X \wedge Y, Z) \approx \mathrm{Hom}(X, \mathrm{Hom}(Y, Z))$ .

Quotient of CW-pair:

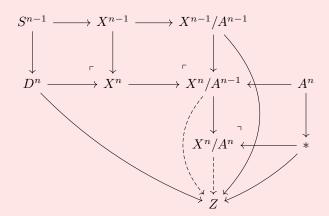

**Proposition 1.15.** For CW-complex X and subcomplex A, the Quotient space X/A have a CW-complex structure induced by X and A.

**Proof.** Suppose the characteristic maps of X are indexed by  $\{I_n\}_{n\in\mathbb{N}}$  and of A are indexed by  $\{I'_n\}_{n\in\mathbb{N}}$  ( $I'_n\subseteq I_n$ ). Then the characteristic maps of X/A are indexed by  $\{K_n\}_{n\in\mathbb{N}}$ , which defined below:

 $K_0 := (I_0 - I_0') \cup \{i_0\}$  where  $i_0$  is an arbitrary element in  $I_0'$ 

 $K_n := I_n - I'_n \text{ for } n > 0.$ 

Verify the maps determine the CW-complex structure:

Smash product of CW-complexes:

**Proposition 1.16.** If  $(X, x_0)$ ,  $(Y, y_0)$  are pointed CW-complexes with both countably many cell, and  $X^{r-1} = \{x_0\}$ ,  $Y^{s-1} = \{y_0\}$ , then  $X \wedge Y := X \times Y/X \vee Y$  is an (r+s-1)-connected CW-complex.

**Proof.**  $X \times Y$  is CW-complex with cells of the form  $e_{i,X}^n \times \{y_0\}$ ,  $\{x_0\} \times e_{j,Y}^m$  or  $e_{i,X}^n \times e_{j,Y}^m$  for  $n \geq r$ ,  $m \geq s$ . Cells of the first two forms are contianed in  $X \vee Y$ , therefore  $(X \wedge Y)^{r+s-1} = *$ .  $\square$ 

Corollary 1.17. If X is a pointed CW-complex, then  $\Sigma^n X$  is an (n-1)-connected CW-complex.

9

## 1.3 Properties of Infinite Symmetric Product

Functoriality:

Pointed map  $f: X \to Y$  induces

$$f_n : \operatorname{SP}^n X \to \operatorname{SP}^n Y$$

$$\{x_1, \dots, x_n\} \mapsto \{f(x_1), \dots, f(x_n)\}$$

$$\longrightarrow \operatorname{SP}^n X \longrightarrow \operatorname{SP}^{n+1} X \longrightarrow$$

$$\longrightarrow \operatorname{SP}^{n} X \longrightarrow \operatorname{SP}^{n+1} X \longrightarrow$$

$$\downarrow^{f_{n}} \qquad \downarrow^{f_{n+1}}$$

$$\longrightarrow \operatorname{SP}^{n} Y \longrightarrow \operatorname{SP}^{n+1} Y \longrightarrow$$

Which induces map  $\mathrm{SP}\,f:\mathrm{SP}\,X\to\mathrm{SP}\,Y.$  And Functorial properties are directly from the constructions above.

 $SP(X_1 \vee X_2) \approx SP(X_1) \times SP(X_2)$ , the homeomorphism is given by:

$$SP(X_1) \times SP(X_2) \leftrightarrows SP(X_1 \vee X_2)$$
$$(\{a_1, a_2, \cdots, a_k\}, \{b_1, b_2, \cdots, b_m\}) \mapsto \{a_1, a_2, \cdots, a_k, b_1, b_2, \cdots, b_m\}$$

Commute with directed colimit:

Suppose P is a directed poset (that is  $\forall x, y \in P, \exists z \in P, x \leq z, y \leq z$ ) and  $X_i$  are pointed spaces indexed by P satisfying  $i \leq j \implies X_i \subseteq X_j$ .

Then  $SP^n(\varinjlim_i X_i) \approx \varinjlim_i (SP^n X_i)$ 

(Proof is obtained by showing that  $SP^n f$  is continuous iff f is, which implies final topology on  $\varinjlim_i (SP^n X_i)$  agree on  $SP^n(\varinjlim_i X_i)$ )

Suppose  $i:A\hookrightarrow X$  is an pointed inclusion, then  $\mathrm{SP}\,i:\mathrm{SP}\,A\hookrightarrow\mathrm{SP}\,X$  is also inclusion. Furthermore, if A is open (or closed) in X, then  $\mathrm{SP}\,A$  is open (or closed) in  $\mathrm{SP}\,X$ .

CW-complex structure of SP:

We can have natural CW-complex structure on  $\prod_n X$  by applying k(-). following theorems allows us to prove that  $SP^n X = \prod_n X/S_n$  have a CW-complex structure.

**Definition 1.8.** G acts cellularly on a CW-complex X if:

$$\forall g \in G, e_i^n \text{ is open } n\text{-cell (of } X)$$
 
$$g(e_i^n) = e_j^n \text{ is open } n\text{-cell (of } X)$$

and  $g(e_i^n) = e_i^n$  implies  $g|_{e_i^n} = id_{e_i^n}$ .

**Lemma 1.18.** If G is a discrete group, X is CW-complex with G cellularly act on X. Then X is a G-CW-complex with n-skeleton  $X^n$ .

**Proof.** The goal is to show  $X^n$  is obtained from  $X^{n-1}$  by attaching G-equivariant cells. Since  $\coprod_{i \in I_n} Y = I_n \times Y$  ( $I_n$  with discrete topology). We have:

$$I_n \times S^{n-1} \xrightarrow{\varphi} X^{n-1}$$

$$\downarrow \qquad \qquad \downarrow$$

$$I_n \times D^n \xrightarrow{\phi} X^n$$

G acts cellularly on open n-cells implies G acts on  $I_n$ . Decomposite  $I_n$  into disjoint unions of obrits  $\coprod_{\alpha \in A} I_\alpha$  choose G-isomorphisms

$$G/H_{\alpha} \cong I_{\alpha}$$
$$gH_{\alpha} \mapsto gi_{\alpha}$$

And we have a well-defined G-map.

$$\phi_{\alpha}|_{e^n}: G/H_{\alpha} \times e^n \cong I_{\alpha} \times e^n \to X^n$$
$$(gH_{\alpha}, x) \mapsto (gi_{\alpha}, x) \mapsto \phi_{gi_{\alpha}}(x) = g\phi_{i_{\alpha}}(x)$$

Since we have  $e^n = \overset{\circ}{D^n}$ , we obtain the following (by continuity):

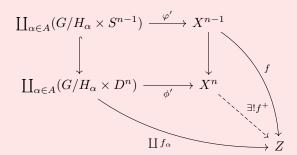

$$\phi_{\alpha}: G/H_{\alpha} \times D^{n} \to X^{n}$$

$$(gH_{\alpha}, x) \mapsto g\phi_{i_{\alpha}}(x)$$

$$\phi_{\alpha}|_{S^{n-1}} = \varphi_{\alpha}: G/H_{\alpha} \times S^{n-1} \to X^{n-1}$$

$$(gH_{\alpha}, s) \mapsto g\varphi_{i_{\alpha}}(s)$$

Let  $\varphi' := \coprod_{\alpha \in A} \varphi_{\alpha}$  and  $\varphi' := \coprod_{\alpha \in A} \varphi_{\alpha}$  we have:

Verify it is indeed a pushout of G-spaces:  $f^+$  (is already determined uniquely as map between G-sets) is map between G-spaces.

Since X have compactly generated topology,  $f^+$  is continuous on each compact subspace of X implies  $f^+$  is continuous on each compactly closed subspace of  $X^n$ , which implies  $f^+$  is continuous on total  $X^n$ .

 $f^+$  is continuous on each closed n-cell  $\{gH_\alpha\} \times D^n$  and  $f^+$  is continuous on  $X^{n-1}$  implies  $f^+$  is continuous on each compact subspace. (since each compact subspace intersect finitely with n-cells and  $X^{n-1}$  (We use  $X^n$  is  $T_2$  to construct open cover))

**Theorem 1.19.** For any topological group morphism  $\phi: H \to G$  we have induced functors: pullback action:

$$G-\mathbf{TOP} \xrightarrow{\phi^*} H-\mathbf{TOP}$$
$$(\alpha(-,-): G \times X \to X) \longmapsto (\alpha(\phi(-),-): H \times X \to X)$$
$$(f: X \to Y) \longmapsto (f: X \to Y)$$

induced action:

$$H-\mathbf{TOP} \xrightarrow{G \times_H -} G-\mathbf{TOP}$$

$$X \longmapsto G \times_H X := (G \times X)/[\ (g\phi(h), x) \sim (g, hx) \mid h \in H]$$

$$(f: X \to Y) \longmapsto (\mathrm{id}_G \times_H f: G \times_H X \to G \times_H Y)$$

Which are adjunctions:

$$H$$
-TOP  $\xrightarrow{G \times_{H} -} G$ -TOP

**Proof.** By G-equivariance, f is determined uniquely by its restriction  $f|_{\phi(H)\times_H X}$ . And  $\tilde{f}:X\to$ 

 $\phi^*(Y)$  uniquely determine a map  $\phi(H) \times_H X \to Y$ .

Naturality:

$$(G \times_H X' \xrightarrow{\operatorname{id}_G \times_H f'} \to G \times_H X \xrightarrow{f} Y \xrightarrow{f''} Y')$$

$$\cup \qquad \qquad \cup \qquad \qquad \cup$$

$$(g, hx') \longmapsto (g, hf'(x)) \longmapsto g\phi(h)f(f'(x)) \longmapsto g\phi(h)f''(f(f'(x)))$$

$$\stackrel{\longleftarrow}{\hookrightarrow}$$

**Proposition 1.20.** If (X, A) is relative G-equivariant CW-complex, then (X/G, A/G) is relative CW-complex with n-skeleton  $X^n/G$ .

Proof.

$$\coprod_{i \in I_n} S^{n-1} \longrightarrow X^{n-1}/G$$

$$\downarrow \qquad \qquad \downarrow$$

$$\coprod_{i \in I_n} D^n \longrightarrow X^n/G$$

Is still pushout since  $-/G = 1 \times_G -$ , and left adjoint preserves colimits.

Since  $k(\prod_n X)$  have CW-complex structure, and  $S_n$  (as a discrete group) acts cellularly on it,  $k(\prod_n X)$  is an  $S_n$ -equivariant CW-complex. Therefore  $\mathrm{SP}^n X = k(\prod_n X)/S^n$  is CW-complex. Since  $\mathrm{SP} X = \varinjlim\{\mathrm{SP}^1 X \hookrightarrow \cdots \hookrightarrow \mathrm{SP}^n X \hookrightarrow \mathrm{SP}^{n+1} X \hookrightarrow \cdots \}$ ,  $\mathrm{SP} X$  is also a CW-complex.

Pointed homotopy  $h: X \times I \to Y$  induces

$$h_n : \operatorname{SP}^n X \times I \to \operatorname{SP}^n Y$$
  
 $(\{x_1, \dots, x_n\}, t) \mapsto \{h(x_1, t), \dots, h(x_n, t)\}$ 

which induces  $SP h : SP X \times I \to SP Y$ .

Then we observe:

 $f \simeq g$  implies SP  $f \simeq$  SP g,

 $e: X \to Y$  is homotopy equivalence implies  $SP e: SP X \to SP Y$  is,

X is contractible implies  $SP^n X$  and then SP X is.

#### **Theorem 1.21.** (Dold-Thom Theorem)

If X is  $T_2$  space and A is closed path-connected subspace of X, and there is neighborhood V deformable to A in X.

Then the quotient map  $q: X \to X/A$  induces quasi-fibration  $SP q: SP X \to SP(X/A)$ , which satisfy  $\forall x \in SP(X/A)$ ,  $(SP q)^{-1}\{x\} \simeq SP A$ .

**Proof.** See here.

**Corollary 1.22.** If X, Y are  $T_2$  spaces and Y is connected,  $f: X \to Y$ . Then consider  $X \to Y \to C_f \to \Sigma X$ , the map  $p: C_f \to \Sigma X$  induces quasi-fibration  $\operatorname{SP} p: \operatorname{SP} C_f \to \operatorname{SP}(\Sigma X)$  with fiber  $\operatorname{SP} Y$ .

Corollary 1.23. If X is  $T_2$  and path-connected, then for any  $q \ge 0$ , there is  $\pi_{q+1}(SP(\Sigma X)) \cong \pi_q(SPX)$ .

**Proof.** CX is contractible implies SPCX is contractible, use the exat homotopy sequence of quasi-fibration to see:

$$\longrightarrow \pi_{q+1}(\operatorname{SP} CX) \longrightarrow \pi_{q+1}(\operatorname{SP} \Sigma X) \xrightarrow{\cong} \pi_q(\operatorname{SP} X) \longrightarrow \pi_q(\operatorname{SP} CX) \longrightarrow$$

*Note.* The inverse of the isomorphism  $\partial$  above is given by

$$[S^q, \operatorname{SP} X] \ni [g] \mapsto [\Sigma g] \in [S^{q+1}, \Sigma \operatorname{SP} X]$$

 $(\Sigma \operatorname{SP} X \cong \operatorname{SP} \Sigma X)$ . Because  $\partial$  is given by:

$$[p \circ Cg] = [\Sigma g] \longleftarrow [Cg] \longleftarrow [g]$$

**Corollary 1.24.** If X is  $T_2$  space and A is path-connected subspace of X, then the canonical map  $SP(X \cup (A \times I)) \to SP(X \cup CA)$  is a quasi-fibration with fiber SP(A).

**Theorem 1.25.** If X is  $T_2$  space and A is path-connected subspace of X, and  $A \hookrightarrow X$  is a cofibration.

Then the quotient map  $q: X \to X/A$  induces quasi-fibration  $SPq: SPX \to SP(X/A)$ , which satisfy  $\forall x \in SP(X/A)$ ,  $(SPq)^{-1}\{x\} \simeq SPA$ .

**Proof.** If  $A \hookrightarrow X$  is cofibration, then  $X \cup CA \simeq X/A$  and  $X \cup (A \times I) \simeq X$ .

**Proposition 1.26.** The inclusion  $S^1 \to SP S^1$  is homotopy equivalence, therefore  $\pi_q(S^1) \cong \pi_q(SP S^1)$ .

**Proof.**  $S^1 \simeq S^2 - \{0, \infty\}$   $SP^n S^2 = \{\{a_1, \dots, a_n\} \mid a_i \in \mathbb{C} \cup \{\infty\}\} = \{\prod_{\{a_1, \dots, a_n\}} (z - a_i) \mid a_i \in \mathbb{C} \cup \{\infty\}\} \text{ where } (z - \infty) := 1$  $SP^n S^2 = \{f \in \mathbb{C}[z] - \{0\} \mid \deg(f) \leq n\} = \mathbb{CP}^n$ 

 $SP^n(S^2 - \{0, \infty\}) = \{ f \in \mathbb{C}[z] - \{0\} \mid \deg(f) \le n, f_n \ne 0, f_0 \ne 0 \} = \mathbb{C}^n - \mathbb{C}^{n-1} \times 0 = \mathbb{C}^{n-1} \times (\mathbb{C} - 0)$  it have the same homotopy type of  $S^1$ 

Corollary 1.27.  $\pi_q(SPS^n) = \mathbb{Z}$  if q = n, otherwise  $\pi_q(SPS^n) = 0$ . (use corollary of 1.21 to see  $\pi_{q+1}(SP\Sigma X) \cong \pi_q(SPX)$ )

# 2 Homology Groups

## 2.1 Reduced Homology Groups

**Definition 2.1.** For a path-connected pointed CW-complex X, define its n-th reduced homology group for  $n \ge 0$ :

$$\tilde{H}_n(X) := \pi_n(\operatorname{SP} X)$$

Note. All reduced homology groups are abelian since  $\tilde{H}_n(X) \cong \tilde{H}_{n+1}(\Sigma X)$ . Thus, we can extend the definition above to those X which does not necessarily be path-connected.

As SP,  $\tilde{H}_n$  also satisfy functoriality. Furthermore,  $\tilde{H}_n$  maps homotopic maps  $f \simeq g$  to identical maps  $f_* = g_*$ . (SP maps homotopic maps to homotopic maps)

Exact Property:

**Proposition 2.1.** For any pointed map between CW-complexes  $f: X \to Y$ , we have an exact sequence:

$$\tilde{H}_n(X) \xrightarrow{f_*} \tilde{H}_n(Y) \xrightarrow{i_*} \tilde{H}_n(C_f)$$

where  $C_f$  is the mapping cone of f,  $i: Y \hookrightarrow C_f$ .

**Proof.**  $Z_f := Y \cup_f (X \times I)/\{x_0\} \times I$  is the **reduced mapping cylinder** of f.  $q: Z_f \to C_f$  is defined by

$$\frac{y \mapsto y}{(x,t)^{Z_f} \mapsto \overline{(x,t)}^{C_f}}$$

By Dold-Thom theorem, the induced map SP q is quasi-fibration SP  $Z_f \to \text{SP } C_f$  with fiber SP X. By definition of quasi-fibration, we have

$$\pi_n(\operatorname{SP} X) \cong \tilde{H}_n(X) \xrightarrow{f_*} \pi_n(\operatorname{SP} Z_f) \cong \tilde{H}_n(Y) \xrightarrow{i_*} \pi_n(\operatorname{SP} C_f) = \tilde{H}_n(C_f)$$

**Proposition 2.2.** There does not exist retraction  $r: \mathbb{D}^n \to S^{n-1}$ .

**Proof.**  $id = r \circ i : \mathbb{S}^{n-1} \to \mathbb{D}^n \to \mathbb{S}^{n-1}$  induces

$$id_* = r_* \circ i_* : \mathbb{Z} \cong \tilde{H}_{n-1} \mathbb{S}^{n-1} \to \tilde{H}_{n-1} \mathbb{D}^n \cong 0 \to \tilde{H}_{n-1} \mathbb{S}^{n-1} \cong \mathbb{Z}$$

which lead to contradiction.

Theorem 2.3. Fix-point theorem:

If  $f: \mathbb{D}^n \to \mathbb{D}^n$  is continuous, then exist  $x_0 \in \mathbb{D}^n$  such that  $x_0 = f(x_0)$ .

**Proof.** (non-constructive) No such  $x_0$  implies  $\forall x \in \mathbb{D}^n, f(x) \neq x$  therefore, we can construct continuous retraction  $r : \mathbb{D}^n \to \mathbb{S}^{n-1}$  by r(x):= the intersection of "ray starting from f(x) to x" and  $\mathbb{S}^{n-1}$ . Contradict to 2.2.

**Definition 2.2.** Let (X, A) be an CW-pair, define the n-th homology group for  $n \in \mathbb{N}$  of (X, A) be:

$$H_n(X,A) := \tilde{H}_n(X \cup CA)$$

And for single space:

$$H_n(X) := H_n(X, \emptyset) = \tilde{H}(X+1)$$

where  $X + 1 := X \sqcup *$ .

Note. Map between CW-pair  $f:(X,A)\to (Y,B)$ , induces map  $\bar{f}:X\cup CA\to Y\cup CB$  defined by  $(x,t)\mapsto (f(x),t)$ , which induces  $f_*:\tilde{H}_n(X\cup CA)\to \tilde{H}_n(Y\cup CB)$  for any  $n\in\mathbb{N}$ .

### 2.2 Axioms for Homology

**Definition 2.3.** A (Ordinary) Homology Theory (on **TOP** with coefficient  $G \in \mathbf{Ab}$ ) is functors  $\{H_n(-,-;G): \mathbf{TOP(2)} \to \mathbf{Ab}\}_{n \in \mathbb{Z}}$ ,

with natural transformations  $\partial_{n,(X,A)}: H_n(X,A;G) \to H_{n-1}(A,\emptyset;G)$  (called connecting homomorphism)

satisfying following axioms:

#### • Dimension:

$$H_0(*,\emptyset;G) = G$$
, for any  $n \neq 0$ ,  $H_n(*,\emptyset;G) = 0$ .

#### • Weak Equivalence:

Weak equivalence  $f:(X,A)\to (Y,B)$  induces isomorphism

$$f_*: H_*(X, A; G) \to H_*(Y, B; G)$$

#### • Long Exact Sequence:

For any  $(X, A) \in \mathbf{TOP(2)}$ , maps  $A \hookrightarrow X$  and  $(X, \emptyset) \to (X, A)$  induce a long exact sequence together with  $\partial$ :

$$\cdots \rightarrow H_{g+1}(A;G) \rightarrow H_{g+1}(X;G) \rightarrow H_{g+1}(X,A;G) \rightarrow H_g(A;G) \rightarrow \cdots$$

where  $H_n(X;G) := H_n(X,\emptyset;G)$ .

#### • Additivity:

If  $(X, A) = \coprod_{\lambda} (X_{\lambda}, A_{\lambda})$  in **TOP(2)**, then inclusions  $i_{\lambda} : (X_{\lambda}, A_{\lambda}) \to (X, A)$  induces isomorphism

$$(\bigoplus i_{*,\lambda}): \bigoplus_{\lambda} H_*(X_{\lambda}, A_{\lambda}; G) \cong H_*(X, A; G)$$

#### • Excision:

If (X; A, B) is an **excisive triad** (that is,  $X = A \cup B$ ), then inclusion  $(A, A \cap B) \hookrightarrow (X, B)$  induces isomorphism

$$H_*(A, A \cap B; G) \cong H_*(X, B; G)$$

Note. An equivalent form of Excision Axiom:

If  $(X, A) \in \mathbf{TOP}(2)$ , U is subspace of A and  $\overline{U} \subseteq A$ , then inclusion  $i : (X - U, A - U) \hookrightarrow (X, A)$  induces isomorphism

$$i_*: H_*(X - U, A - U; G) \to H_*(X, A; G)$$

There is a critical criterion about weak homotopy equivalence between excisive triads, we prove lemmas first:

#### Lemma 2.4. For

$$Z \xrightarrow{f} Y$$

$$\downarrow i \qquad \qquad \downarrow i_*$$

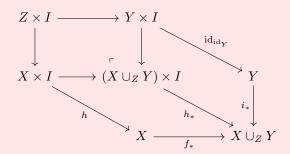

$$X \xrightarrow{f} X \cup_Z Y$$

if D is deformation retract of X and  $Z \subseteq D \subseteq X$ , then  $D \cup_Z Y$  is deformation retract of  $X \cup_Z Y$ .

**Proof.** Let  $h: \mathrm{id}_X \simeq r \circ i$  where r is the deformation retraction  $X \to D$ . Define  $h_*: \mathrm{id}_{X \cup_Z Y} \simeq (i \cup_Z \mathrm{id}_Y) \circ (r \cup_Z \mathrm{id}_Y)$ 

$$h_*: (X \cup_Z Y) \times I \to X \cup_Z Y$$
$$(x,t) \mapsto f_*(h(x,t))$$
$$(y,t) \mapsto i_*(y)$$

Observe that  $(X \cup_Z Y) \times I = (X \times I) \cup_{Z \times I} (Y \times I)$ , check that  $h^*$  is continuous:

**Lemma 2.5.** For maps  $i: C \to A$ ,  $j: C \to B$  define the double mapping cylinder  $M(i,j) := A \cup_{C \times \{0\}} C \times I \cup_{C \times \{1\}} B$ . If i is closed cofibration, then the quotient map

$$q: M(i,j) \to A \cup_C B$$
$$a \mapsto a$$
$$b \mapsto b$$
$$(c,t) \mapsto c$$

is a homotopy equivalence.

#### Proof.

$$\begin{array}{ccc}
C & \longrightarrow B \\
\downarrow & & \downarrow \\
A & \xrightarrow{i_A} A \cup_C B
\end{array}$$

The canonical quotient  $r: M_{i_A} \to A \cup_C B$  is a deformation retraction with homotopy:

$$h: (B \cup_{C \times 0} (A \times I)) \times I \to B \cup_{C \times 0} (A \times I) = M_{i_A}$$
$$(a, t, s) \mapsto (a, (1 - s)t)$$
$$(b, s) \mapsto b$$

Observe that  $C \times I \cup_C A \times \{1\}$  is a deformation retract of  $A \times I$ , since  $i: C \to A$  is closed cofibration

Then we have  $M(i,j) = B \cup_{C \times \{0\}} (C \times I \cup_{C \times \{1\}} A \times \{1\})$  is a deformation retract of  $B \cup_{C \times \{0\}} A \times I = M_{i_A}$ . (use lemma 2.4)

Finally, an easy check shows that  $M(i,j) \to M_{i_A} \xrightarrow{r} A \cup_C B$  is identical to q.

**Theorem 2.6.** For excisive triads  $(X; X_1, X_2)$ ,  $(X'; X'_1, X'_2)$  and map  $e: X \to X'$ , if

$$e|_{X_1}: X_1 \to X_1'$$
  
 $e|_{X_2}: X_2 \to X_2'$   
 $e|_{X_3}: X_3 \to X_3'$ 

are weak equivalences, (where  $X_3 := X_1 \cap X_2$ ,  $X_3' := X_1' \cap X_2'$ ) then e is.

**Proof.** Use an important criterion of weak homotopy equivalence, it suffices to show for all  $n \in \mathbb{N}$ , any commutative diagram below:

$$S^{n} \xrightarrow{i} D^{n+1}$$

$$\downarrow f$$

$$X \xrightarrow{e} X'$$

can be filled like:

$$S^{n} \xrightarrow{i} D^{n+1}$$

$$\downarrow g \qquad \downarrow g^{+} \qquad \downarrow f$$

$$X \xrightarrow{g} X'$$

whose upper triangle commutes.

Let

$$A_1 := g^{-1}(X - \overset{\circ}{X_1}) \cup f^{-1}(X' - \overset{\circ}{X_1'})$$
$$A_2 := g^{-1}(X - \overset{\circ}{X_2}) \cup f^{-1}(X' - \overset{\circ}{X_2'})$$

which are disjoint closed subsets of  $D^{n+1}$ . Choose CW-complex structure on  $D^{n+1}$  such that for each n-cell  $\sigma_i$ ,  $\overline{\sigma_i} \cap (A_1 \cup A_2) = \overline{\sigma_i} \cap A_1$  or  $\overline{\sigma_i} \cap A_2$ . Now define

$$K_1 := \bigcup \{ \overline{\sigma_i} \mid g(\overline{\sigma_i} \cap S^n) \subseteq \overset{\circ}{X_1} \text{ and } f(\overline{\sigma_i}) \subseteq \overset{\circ}{X_1'} \} = \bigcup \{ \overline{\sigma_i} \mid \overline{\sigma_i} \cap A_1 = \emptyset \}$$

$$K_2 := \bigcup \{ \overline{\sigma_i} \mid g(\overline{\sigma_i} \cap S^n) \subseteq \overset{\circ}{X_2} \text{ and } f(\overline{\sigma_i}) \subseteq \overset{\circ}{X_2'} \} = \bigcup \{ \overline{\sigma_i} \mid \overline{\sigma_i} \cap A_2 = \emptyset \}$$

which are subcomplexes of  $D^{n+1}$  and satisfy  $K_1 \cup K_2 = D^{n+1}$ . By HELP, we have:

$$S^{n} \cap K_{1} \cap K_{2} \xrightarrow{i} K_{1} \cap K_{2}$$

$$g|_{K_{1} \cap K_{2}} \downarrow \qquad \qquad \downarrow f|_{K_{1} \cap K_{2}}$$

$$X_{1} \cap X_{2} \xrightarrow{e|_{X_{1} \cap X_{2}}} X'_{1} \cap X'_{2}$$

such that  $h_0$  is  $f|_{K_1\cap K_2}\simeq e\circ g_0\operatorname{rel}(S^n\cap K_1\cap K_2)$ . Apply HELP to:

$$(S^{n} \cup K_{1}) \cap K_{2} \xrightarrow{i_{2}} K_{2} \qquad (S^{n} \cup K_{2}) \cap K_{1} \xrightarrow{i_{1}} K_{1}$$

$$g_{K_{2}} \downarrow \qquad \downarrow^{f|_{K_{2}}} \qquad g_{K_{1}} \downarrow \qquad \downarrow^{f|_{K_{1}}} \downarrow^{f|_{K_{1}}}$$

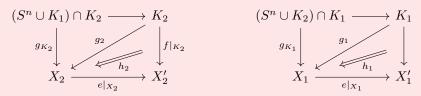

$$X_{2} \xrightarrow{X_{2}'} X_{2}' \qquad X_{1} \xrightarrow{X_{1}'} X_{1}'$$

where

 $g_{K_i}$  are defined by  $g_{K_i}|_{S^n\cap K_i}:=g|_{S^n\cap K_i}$  and  $g_{K_i}|_{K_1\cap K_2}:=g_0$ ,  $h_{K_2}$  are defined by  $(h_{K_1}$  is similar):

$$h_{K_2}: ((S^n \cup K_1) \cap K_2) \times I \to X_2'$$
 
$$(x,t) \mapsto \begin{cases} e(g(x)) & x \in S^n \cap K_2 \\ h_0(x,t) & x \in K_1 \cap K_2 \end{cases}$$

We get:

Define  $g^+$  and  $h: f \simeq g \text{ rel } S^n$  by  $g^+|_{K_i} := g_i$  and  $h|_{K_i \times I} := h_i$ .  $h|_{S^n \times I} = (e \circ g) \times \text{id}_I$  ( $h \text{ is rel } S^n$ ) since  $h_i(-,t)|_{S^n \cap K_i} = h_{K_i}(-,t)|_{S^n \cap K_i} = e \circ g|_{S^n \cap K_i}$ .

*Note.* The proof above can be easily modified to case each weak equivalence appear in the statement is an n-equivalence.

Following theorem allow us to use CW-triads to approximate excisive triads:

**Theorem 2.7.** For any excisive triad (X; A, B), there is a CW-triad  $(\widetilde{X}; \widetilde{A}, \widetilde{B})$  (A CW-triad (X; A, B) is X and its subcomplex A, B such that  $A \cup B = X$ ) and a map  $r : \widetilde{X} \to X$  such that

$$\begin{split} r|_{\widetilde{A}} : \widetilde{A} &\to A \\ r|_{\widetilde{B}} : \widetilde{B} &\to B \\ r|_{\widetilde{C}} : \widetilde{C} &\to C \\ r : \widetilde{X} &\to X \end{split}$$

are all weak homotopy equivalences (where  $\widetilde{C} := \widetilde{A} \cap \widetilde{B}$ ,  $C := A \cap B$ ). Furthermore, such r is natural up to homotopy.

**Proof.** Choose a CW-approximation  $r_C: \widetilde{C} \to C$  and extend it to  $r_A: \widetilde{A} \to A$ ,  $r_B: \widetilde{B} \to B$ .  $\widetilde{X} := \widetilde{A} \cup_{\widetilde{C}} \widetilde{B}$ .  $i: \widetilde{C} \to \widetilde{A}$  and  $j: \widetilde{C} \to \widetilde{B}$  are closed cofibrations, by lemma 2.5 we have homotopy equivalence  $q: M(i,j) \to \widetilde{X}$ , which induces homotopy equivalence of triads:

$$\begin{split} q: M(i,j) &\to \widetilde{X} \\ q|: \widetilde{A} \cup (\widetilde{C} \times [0,\frac{2}{3})) &\to \widetilde{A} \\ q|: \widetilde{B} \cup (\widetilde{C} \times (\frac{1}{3},1]) &\to \widetilde{B} \end{split}$$

then we can deduce that  $r \circ q$  is a weak homotopy equivalence by theorem 2.6. Consequently, r is weak homotopy equivalence. r is natural up to homotopy since each CW-approximation  $r_C, r_A, r_B$  is.

Then we have:

**Definition 2.4.** A (Ordinary) Homology Theory on CW-complexes with coefficient  $G \in \mathbf{Ab}$  is functors  $\{H_n(-,-;G): \mathbf{CW\text{-}pairs} \to \mathbf{Ab}\}_{n \in \mathbb{Z}}$ ,

with natural transformations  $\partial_{n,(X,A)}: H_n(X,A;G) \to H_n(A,\emptyset;G)$  (called connecting homomorphism)

satisfying axioms with the excision axiom changed to:

#### • Excision:

If (X;A,B) is an **CW-triad** (that is  $X = A \cup B$  for subcomplexes A and B) then the inclusion  $(A,A \cap B) \hookrightarrow (X,B)$  induces isomorphism

$$H_*(A, A \cap B; G) \cong H_*(X, B; G)$$

**Proposition 2.8.** The homology groups defined in definition 2.2 with  $H_{-n}(X) := 0$  is a ordinary homology theory on CW-complexes with coefficient  $\mathbb{Z}$ .

Proof.

• Dimension: by a corollary, 
$$H_q(*,\emptyset) = \pi_q(\operatorname{SP} S^0) = \begin{cases} \mathbb{Z} & q=0\\ 0 & q \geq 1 \end{cases}$$

- Weak Equivalence: SP preserves weak equivalence.
- $\bullet$  Long Exact Sequence: use a corollary of Dold-Thom theorem.
- Additivity: For index set  $\Lambda$ ,  $P := \{S \mid S \subseteq \Lambda\}$ . Then define  $Y_S := \bigvee_{\lambda \in S} X_\lambda \cup CA_\lambda = (\coprod_{\lambda \in S} X_\lambda) \cup C(\coprod_{\lambda \in S} A_\lambda)$ , and use fact that SP commutes with directed colimit, we have

 $\bigvee_{\lambda \in \Lambda} \operatorname{SP}(X_{\lambda} \cup CA_{\lambda}) = \varinjlim_{S \in P} \operatorname{SP}(Y_{S} \approx \operatorname{SP}(\varinjlim_{S \in P} Y_{S})) = \operatorname{SP}((\coprod_{\lambda \in \Lambda} X_{\lambda}) \cup C(\coprod_{\lambda \in \Lambda} A_{\lambda})) = \operatorname{SP}(X \cup CA).$ 

Which induces  $\bigoplus_{\lambda \in \Lambda} \tilde{H}_n(X_\lambda \cup CA_\lambda) \cong \pi_n(\bigvee_{\lambda \in \Lambda} SP(X_\lambda \cup CA_\lambda)) \cong \pi_n(SP(X \cup CA)) = \tilde{H}_n(X \cup CA).$ 

• Excision: For CW-triad (X; A, B),  $A/(A \cap B) \approx X/B$ . Apply theorem 1.25 to  $(Y \cup CZ, CZ)$  to show that  $H_n(Y, Z) \cong \tilde{H}_n(Y/Z)$ .

## 2.3 Cellular Homology

**Lemma 2.9.** For an ordinary homology theory  $H_*(-,-;G)$ , if X is a CW-complex, then for any  $n \in \mathbb{Z}$   $H_n(X) \cong \tilde{H}_{n+1}(\Sigma X)$ .

**Proof.** Apply long exact sequence axiom on (CX, X):  $(H_*(CX) = 0$  due to weak equivalence axiom):

$$0 \cong H_{n+1}(CX) \to H_{n+1}(CX, X) \xrightarrow{\cong} H_n(X) \to H_n(CX) \cong 0$$

Use excision axiom and weak equivalence axiom, we have:

$$H_*(CX,X) \cong H_*(CX \cup CX,CX) \cong H_*(\Sigma X,*)$$

**Proposition 2.10.** For an ordinary homology theory  $H_*(-,-;G)$ , if X is a pointed CW-complex with  $X^{-1} := *$ , then for any  $n \ge 0$ 

$$H_q(X^n,X^{n-1}) \cong \tilde{H}_q(X^n/X^{n-1}) \cong \begin{cases} \bigoplus_{i \in I_n} G & q=n \\ 0 & q \neq n \end{cases}$$

where  $I_n$  is set of all q-cells.

**Proof.** Use additivity axiom and lemma 2.9 to see that  $H_n(\bigvee S^n) \cong \bigoplus G$  and  $H_q(\bigvee S^n) = 0$  for  $q \neq n$ . Use excision axiom and weak equivalence axiom to see

$$H_q(X^n, X^{n-1}) \cong H_q(X^n \cup CX^{n-1}, CX^{n-1}) \cong H_q(X^n / X^{n-1}, *) \cong \tilde{H}_q(\bigvee_{i \in I_n} S^n)$$

**Corollary 2.11.** If  $H_*(-,-)$  is an ordinary homology theory, then for a pointed CW-complex X with  $X^{-1} := *$ , we have:

$$\tilde{H}_q(X^n) = 0$$
 for  $q > n$   
 $H_q(X^n) \cong H_q(X^{n+1}) \cong H_q(X)$  for  $q < n$   
 $H_n(X^n) \xrightarrow{i_*} H_n(X^{n+1})$  is epimorphism

for any  $n \geq -1$ .

**Proof.** Use long exact sequence of  $(X^{n+1}, X^n)$ :

$$\cdots \to H_{q+1}(X^{n+1}, X^n) \xrightarrow{\partial_{q+1}} H_q(X^n) \xrightarrow{i_*} H_q(X^{n+1}) \to H_q(X^{n+1}, X^n) \xrightarrow{\partial_q} H_{q-1}(X^n) \to \cdots$$
$$\cdots \to H_1(X^{n+1}, X^n) \xrightarrow{\partial_1} H_0(X^n) \xrightarrow{i_*} H_0(X^{n+1}) \to H_0(X^{n+1}, X^n)$$

For q < n,  $H_q(X^n) \cong H_q(X^{n+1}) \cong \cdots \cong \varinjlim_{i \in \mathbb{N}} H_q(X^i)$ . For q > n, if n > -1,  $H_q(X^n) \cong H_q(X^{n-1}) \cong \cdots \cong H_q(X^{-1}) \cong 0$ , if n = -1,  $\tilde{H}_0(X^{-1}) \cong 0 \cong \tilde{H}_q(X^{-1})$ .

For q = n, we have following exact:

$$\to H_{n+1}(X^{n+1}, X^n) \xrightarrow{\partial_{n+1}} H_n(X^n) \xrightarrow{i_*} H_n(X^{n+1}) \to H_n(X^{n+1}, X^n) \cong 0$$

**Definition 2.5.** For pointed CW-complex X with  $X^{-1} := *$  and a ordinary homology theory  $H_*(-,-)$  the (reduced) **cellular chain complex**  $\{\tilde{C}_n(X),d_n\}$  of X is defined by:

$$\tilde{C}_n(X) := H_n(X^n, X^{n-1})$$

$$d_n : H_n(X^n, X^{n-1}) \xrightarrow{\partial_n} H_{n-1}(X^{n-1}) \xrightarrow{i_*} H_{n-1}(X^{n-1}, X^{n-2})$$

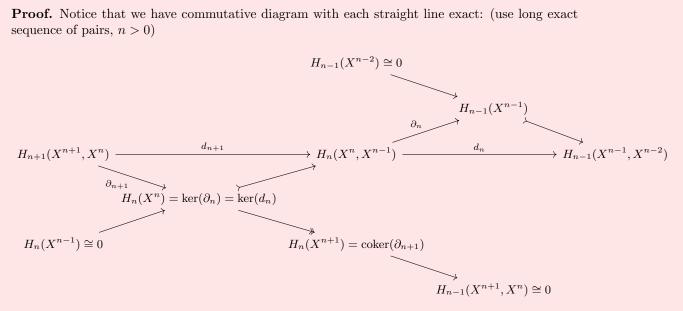

*Note.* Use cellular approximation, we can see that the construction  $\tilde{C}_*(-)$  is a functor.

**Theorem 2.12.** For any ordinary homology theory  $H_*(-,-)$  and any pointed CW-complex X, (with  $X^{-1} := *$ ) the n-th homology of cellular chain complex is isomorphic to  $H_n(X)$ :

$$H_n(\tilde{C}_*(X)) \cong H_n(X,*)$$

if we set  $X^{-1} := \emptyset$  in our  $\tilde{C}_*(X)$ , then  $H_n(\tilde{C}_*(X)) \cong H_n(X, \emptyset)$ .

**Proof.** Notice that we have commutative diagram with each straight line exact: (use long exact sequence of pairs, n > 0)

For n = 0:

$$H_1(X^1, X^0) \xrightarrow{d_1} H_0(X^0, X^{-1}) \longrightarrow \operatorname{coker}(d_1) \cong H_0(X^1, X^{-1}) \longrightarrow H_0(X^1, X^0) \cong 0$$

Note. If the ordinary homology theory has coefficient  $\mathbb{Z}$ , then the  $d_n: \tilde{C}_n(X) \to \tilde{C}_{n-1}(X)$  is given by:

$$\mathbb{Z}_i \ni 1_i = e_i^n \mapsto \sum_{j \in I_{n-1}} \alpha_i^j e_j^{n-1}$$

where  $\alpha_i^j$  is degree of map

$$\beta_i^j: S^n \approx \partial e_i^n \xrightarrow{\varphi_i} X^{n-1} \to X^{n-1}/X^{n-2} \to \bigvee_{j' \in I_{n-1}} S^{n-1} \xrightarrow{p_j} S^{n-1}$$

where  $\varphi_i$  is the characteristic map,  $p_j$  maps every point not in  $S_j^{n-1}$  to \*.

**Corollary 2.13.** For any ordinary homology theory  $H_*(-,-)$  and any relative CW-complex (X,A), the cellular chain of X with is  $X^{-1} := A$  noted  $C_*(X,A)$ , we have:

$$H_n(C_*(X,A)) \cong H_n(X/A,*) \cong H_n(X,A)$$

**Proposition 2.14.** If (X, A) is a (pointed) CW-pair, (with  $X^{-1} := * =: A^{-1}$ ) use the natural relative CW-complex (X, A) to obtain  $C_*(X, A)$ , then  $\tilde{C}_*(X)/\tilde{C}_*(A) \cong C_*(X, A)$  naturally.

**Proof.**  $H_n(X^n, X^{n-1})/H_n(A^n, A^{n-1}) \cong H_n((X/A)^n, (X/A)^{n-1})$  and  $H_0(X^0, X^{-1})/H_n(A^0, A^{-1}) \cong H_n((X/A)^0, (X/A)^{-1})$ . Naturality:

$$\begin{array}{c|c} \bigoplus_{I_X^n} \mathbb{Z} & \xrightarrow{\cong} & \bigoplus_{I_X^n - I_A^n} \mathbb{Z} \\ & \bigoplus_{I_A^n} \mathbb{Z} & & & \downarrow f_* \\ & & & \downarrow f_* \\ & \bigoplus_{I_Y^n} \mathbb{Z} & \xrightarrow{\cong} & \bigoplus_{I_Y^n - I_B^n} \mathbb{Z} \end{array}$$

where  $I_Z^n$  is the index set of n-cells of  $Z, f: (X, A) \to (Y, B)$  is a cellular map.

3 Homotopy and Eilenberg-Mac Lane Spaces

## 3.1 Homotopy Excision Theorem and its Corollary

**Theorem 3.1.** (Blakers–Massey) Homotopy Excision Theorem: For pointed CW-triad (X; A, B) such that  $C := A \cap B \neq \emptyset$ , if (A, C) is (m-1)-connected and (B, C) is (n-1)-connected where  $m \geq 2$ ,  $n \geq 1$ . Then  $i : (A, C) \rightarrow (X, B)$  is an (m+n-2)-equivalence for pairs.

Note. We can replace the "CW-triad" with "excisive triad" in condition by theorem 2.7.

**Proof.** See here.

**Corollary 3.2.** Suppose that  $Y_0 \hookrightarrow Y$  is cofibration,  $(Y, Y_0)$  is (r-1)-connected and  $Y_0$  is (s-1)-connected, then  $(Y, Y_0) \rightarrow (Y/Y_0, *)$  is (r+s-1)-equivalence.  $(r \geq 2, s \geq 1)$ 

**Proof.**  $Y_0 \hookrightarrow CY_0$  is cofibration and  $(CY_0, Y_0)$  is s-connected. Use homotopy excision theorem (with  $X = Y \cup CY_0$ , A = Y,  $B = CY_0$ ,  $C = Y_0$ ) to see  $(Y, Y_0) \rightarrow (Y \cup CY_0, CY_0)$  is (r + s - 1)-equivalence. And  $(Y \cup CY_0, CY_0) \rightarrow (Y/Y_0, *)$  is homotopy equivalence since  $Y_0 \hookrightarrow Y$  is cofibration.

Corollary 3.3. For  $n \ge 2$ ,  $f: X \to Y$  is (n-1)-equivalence between (s-1)-connected spaces, then  $(M_f, X) \to (C_f^+, *)$  is (n+s-1)-equivalence. Where  $C_f^+:=Y \cup_f C^+X$ ,  $C^+X:=(X \times I)/(X \times \{1\})$  is the unreduced mapping cone and the unreduced cone.

**Proof.** f is (n-1)-equivalence implies  $(M_f, X)$  is (n-1)-connected. Use corollary above.

**Corollary 3.4.** For  $n \geq 2$ , if  $f: X \to Y$  is pointed map between (n-1)-connected well-pointed spaces (that is, pointed space whose inclusion of the base point is (closed) cofibration). Then  $C_f$  is (n-1)-connected and  $\pi_n(M_f, X) \to \pi_n(C_f, *)$  is isomorphism.

**Proof.** Use homotopy extension property to extend to unreduced case. f is map between (n-1)-connected space implies f is at least a (n-1)-equivalence. Therefore  $(M_f, X) \to (C_f, *)$  is (2n-1)-equivalence, Since we have n < 2n-1 for any  $n \ge 2$ ,  $\pi_n(M_f, X) \to \pi_n(C_f, *)$  is isomorphism.

**Theorem 3.5.** (Freudenthal Suspension Theorem) If X is well-pointed and (n-1)-connected  $(n \ge 1)$ , then the map:

$$\sigma: \pi_q(X) \to \pi_{q+1}(\Sigma X) \cong \pi_q(\Omega \Sigma X)$$
$$f \mapsto \Sigma f$$

is isomorphism if q < 2n - 1 and epimorphism if q = 2n - 1.

**Proof.** If we have  $f:(I^q,\partial I^q)\to (X,*)$  then  $f\times\operatorname{id}_I:I^{q+1}\to X\times I$  will give a map  $\overline{f\times\operatorname{id}_I}:(I^{q+1},\ \partial I^{q+1},\ \partial I^q\times I\cup\partial I\times\{1\})\to (CX,X,*)$  since  $J^q=\partial I^q\times I\cup\partial I\times\{0\}$ , it does not give a map in  $\pi_{q+1}(CX,X)$ . we should change  $\overline{f\times\operatorname{id}_I}$  into  $\overline{f\times\operatorname{-id}_I}$ . we have commutative diagram:

Where  $p:(CX,X)\to (CX/X,*)$  is the canonical quotient map and  $i:[f]\to [\overline{f\times -\mathrm{id}_I}]$  makes  $\pi_{q+1}(CX)\to \pi_{q+1}(CX,X)\to \pi_q(X)\to \pi_q(CX)$  split in middle (that is, i is inverse of the connecting homomorphism  $\partial$ ). We verify the commutativity:

$$-\Sigma f: (I^{q+1}, \partial I^{q+1}) \to (CX/X, *)$$

$$(s,t) \mapsto f(s) \land (1-t)$$

$$p \circ (\overline{f \times -id_I}): (I^{q+1}, \partial I^{q+1}) \to (CX/X, *)$$

$$(s,t) \mapsto f(s) \land (1-t)$$

Since  $X \hookrightarrow CX$  is cofibration and n-equivalence between (n-1)-connected spaces, p is an 2n-equivalence. Therefore, q+1 < 2n implies  $-\sigma$  is isomorphism, q+1=2n implies  $-\sigma$  is epimorphism, and we have  $-\sigma$  is iff  $\sigma$  is.

**Corollary 3.6.** If Y is well pointed (n-1)-connected space then  $Y \to \Omega \Sigma Y$  is (2n-1)-equivalence. By theorem 1.3, for any CW-complex X with  $\dim X < 2n-1$ ,  $\Sigma : [X,Y]_* \to [\Sigma X, \Sigma Y]_* \cong [X,\Omega \Sigma Y]_*$  is bijection.

**Definition 3.1.** We now define the q-th stable homotopy group:

$$\pi_k^s(X) := \lim_{\substack{\longrightarrow\\r}} \pi_{k+r}(\Sigma^r X) \cong \pi_{2k+2}(\Sigma^{k+2} X) \cong \pi_{k+n}(\Sigma^n X) \qquad (n-1 > k)$$

(Since  $\Sigma^n X$  is (n-1)-connected) And stable homotopy class:

$$[X,Y]^s_* := \varinjlim_r [\Sigma^r X, \Sigma^r Y]$$

*Note.* We'll see later that  $\{\pi_n^s\}_{n\in\mathbb{N}}$  defines a generalized homology theory.

## 3.2 Hurewicz Theorem

First, we use homotopy excision theorem to prove following lemmas:

**Lemma 3.7.** (every  $S_a^n \approx S^n$ ) We have canonical  $i_a : S_a^n \hookrightarrow \bigvee_{a \in A} S_a^n$  and for n > 1:

$$\pi_n(\bigvee_{a\in A} S_a^n) \cong \bigoplus_{a\in A} \mathbb{Z}_a$$

where  $[i_a] = 1 \in \mathbb{Z}_a \subseteq \bigoplus_{a \in A} \mathbb{Z}_a$  and every  $\mathbb{Z}_a \cong \mathbb{Z}$ . For n = 1:

$$\pi_n(\bigvee_{a\in A} S_a^1) \cong \coprod_{a\in A} \mathbb{Z}_a$$

where  $\coprod$  is taken in category  $\mathbf{Grp}$ ,  $[i_a] = 1 \in \mathbb{Z}_a \subseteq \coprod_{a \in A} \mathbb{Z}_a$  and every  $\mathbb{Z}_a \cong \mathbb{Z}$ .

#### Proof.

Case n = 1:

Apply the Seifert-van Kampen theorem.

Case n > 1:

Suppose each  $S_a^n$  have CW-complex structure with one 0-cell and one n-cell. Consider finite product  $\prod_{1 \leq i \leq k} S_i^n$  and its subcomplex, finite wedge product  $\bigvee_{1 \leq i \leq k} S_i^n$ . The inclusion

$$\bigvee_{1 \le i \le k} S_i^n \hookrightarrow \prod_{1 \le i \le k} S_i^n$$

is (2n-1)-equivalence since  $\prod_{1\leq i\leq k}S_i^n-\bigvee_{1\leq i\leq k}S_i^n$  only have cells of dim  $\geq 2n$ . (use lemma 1.13) Use exact homotopy sequence of pair, we deduce that  $\pi_q(\bigvee_{1\leq i\leq k}S_i^n)\to \pi_q(\prod_{1\leq i\leq k}S_i^n)\cong \bigoplus_{1\leq i\leq k}\mathbb{Z}$  is an isomorphism for  $q\leq 2n-2$ . And  $S_i^n\to\bigvee_{1\leq i\leq k}S_i^n\to\prod_{1\leq i\leq k}S_i^n$  is just the i-th inclusion  $S_i^n\to\prod_{1\leq i\leq k}S_i^n$  which represents  $1\in\mathbb{Z}_i\hookrightarrow\bigoplus_{1\leq i\leq k}\mathbb{Z}_i$ . Infinite wedge case:

$$\bigoplus_{1 \leq i \leq k} \pi_q(S_i^n) \xrightarrow{\cong} \pi_q(\bigvee_{1 \leq i \leq k} S_i^n)$$

$$\downarrow \qquad \qquad \downarrow$$

$$\bigoplus_{a \in A} \pi_q(S_a^n) \xrightarrow{\bigoplus_{a \in A} i_{a*}} \pi_q(\bigvee_{a \in A} S_a^n)$$

 $\bigoplus_{a\in A} i_{a*}$  is monomorphism since every homotopy  $S^n\times I\to \bigvee_{a\in A} S^n_a$  has a compact image, and  $\bigoplus_{a\in A} i_{a*}$  is epimorphism since every map  $S^n\times I\to \bigvee_{a\in A} S^n_a$  has a compat image.

**Lemma 3.8.** For  $n \ge 1$ , if we have a map  $f: \coprod_{a \in A} \mathbb{Z}_a \to \coprod_{b \in B} \mathbb{Z}_b$  (case n = 1) or a map  $f: \bigoplus_{a \in A} \mathbb{Z}_a \to \bigoplus_{b \in B} \mathbb{Z}_b$  (case n > 1). Then there exists a map  $\phi: \bigvee_{a \in A} S_a^n \to \bigvee_{b \in B} S_b^n$  unique up to homotopy and satisfy  $\pi_n(\phi) = f$ .

**Proof.** Suppose  $f(1_a) = [\phi_a] \in [S^n, \bigvee_{b \in B} S^n_b]_*$ , then  $\phi_a$  is indeed a map  $S^n_a \to \bigvee_{b \in B} S^n_b$ . Now we define  $\phi := \bigvee_a \phi_a : \bigvee_{a \in A} S^n_a \to \bigvee_{b \in B} S^n_b$ . For any  $a \in A$ ,  $\phi|_{S^n_a} = \phi_a$ , we have

$$\pi_n(\phi)(1_a) = [\phi|_{S_a^n} \circ \mathrm{id}_{S_a^n}] = [\phi_a] = f(1_a)$$

which implies  $\pi_n(\phi) = f$  since they are group homomorphisms.

Uniqueness up to homotopy:  $\pi_n(\phi)[1_a] = \pi_n(\phi')[1_a]$  implies  $\phi|_{S_a^n} \simeq \phi'|_{S_a^n}$  rel\*. Therefore  $\phi \simeq \phi'$  rel\*.

**Definition 3.2.** If  $H_n$  is a ordinary homology theory with coefficient  $\mathbb{Z}$ , then the map

$$h_X: \pi_n(X) \to \tilde{H}_n(X) := H_n(X, *)$$

$$[f] \mapsto f_*(1) \qquad (f_*: \tilde{H}_n(S^n) \to \tilde{H}_n(X))$$

is called **Hurewicz Homomorphism**.

*Note.*  $h_{(-)}$  is natural transformation since we have

$$\pi_{n}(X) \xrightarrow{h_{X}} \tilde{H}_{n}(X) \qquad [f] \longmapsto f_{*}(1)$$

$$\downarrow g_{*} \qquad \qquad \downarrow \qquad \qquad \qquad \downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow \qquad \qquad \qquad \downarrow \qquad \qquad$$

commutes. Moreover, it commutes with connecting homomorphism.

**Lemma 3.9.** If  $X = \bigvee_{a \in A} S^n$ ,  $h_X : \pi_n(X) \to \tilde{H}_n(X)$  is abelianization if n = 1, isomorphism if  $n \geq 2$ .

**Proof.** Directly from lemma 3.8. (we used homotopic properties of spheres only in proving is lemma)  $\Box$ 

**Theorem 3.10.** (Hurewicz) If X is (n-1)-connected, then  $h_X : \pi_n(X) \to \tilde{H}_n(X)$  is abelianization if n = 1, isomorphism if  $n \geq 2$ .

**Proof.** We can assume X is CW-complex with  $X^{n-1} = *$  and each characteristic map is pointed. (since we have theorem 1.5)

For CW-complex X,  $\pi_n(X^{n+1}) \cong \pi_n(X)$  and  $H_n(X^{n+1}) \cong H_n(X)$ , Since we have cellularity of homotopy group and cellularity of homology.

Then we have  $X^n = \bigvee_{b \in B} S_b^n$ ,  $X^{n+1} = C_{\phi}$  where  $\phi : \bigvee_{a \in A} S_a^n \to X^n$  are the characteristic maps. Use naturality of  $h_{(-)}$ , we have maps between exact sequence:

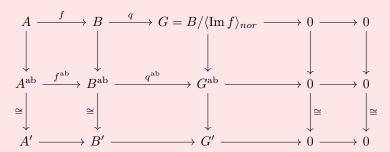

$$\pi_n(\bigvee_{a \in A} S_a^n) \xrightarrow{\phi_*} \pi_n(X^n) \longrightarrow \pi_n(C_\phi) \longrightarrow 0$$

$$\downarrow^{h_{\bigvee_{a \in A} S_a^n}} \qquad \downarrow^{h_{X^n}} \qquad \downarrow^{h_{C_\phi}}$$

$$\tilde{H}_n(\bigvee_{a \in A} S^n) \xrightarrow{\phi_*} \tilde{H}_n(X^n) \longrightarrow \tilde{H}_n(C_\phi) \longrightarrow 0$$

If n > 1, exactness of top row is directly from lemma 3.2.  $((M_{\phi}, \bigvee_{a \in A} S_a^n))$  is (n-1)-connected since we have lemma 1.13) 5-lemma shows that  $h_{C_{\phi}}$  is isomorphism.

If n=1, Seifert-van Kampen theorem shows that  $\pi_1(C_\phi) = \pi_1(X^n)/\langle \operatorname{Im} \phi_* \rangle_{nor}$ . (where for  $A \subseteq$  a group G,  $\langle A \rangle_{nor} := \{gAg^{-1} \mid g \in G\}$ ). The top row is not exact, but top row's abelianization is exact since  $\langle \operatorname{Im} f \rangle_{nor}/[B,B] = \operatorname{Im} f/[B,B]$  for any group morphism  $f: A \to B$ . Therefore we have diagram below with the middle row and the bottom row exact:

Finally apply 5-lemma on the middle row and the bottom row.

**Corollary 3.11.** (Relative version of Hurewicz theorem) If (X, A) is (n-1)-connected CW-pair, A is 1-connected subcomplex and  $n \geq 2$ , then the Hurewicz morphism  $h_{(X,A)} : \pi_n(X,A) \to H_n(X,A)$  (defined analogue to  $h_X$ ) is isomorphism.

**Proof.** Use theorem 3.2 and Hurewicz theorem of  $h_{X/A}$ .

Uniqueness of Ordinary Homology Theory:

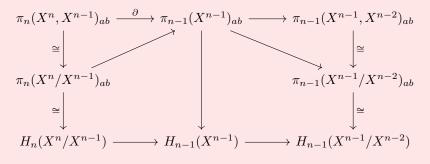

**Theorem 3.12.** If  $H_*(-,-)$  is ordinary homology theory with coefficient  $\mathbb{Z}$  on CW-complexes, then  $H_*(-,-)$  is unique up to natural isomorphism.

**Proof.** Since  $H_n(C_*(X)) \cong H_n(X)$  naturally (in X), our goal is to prove the complex defined by

$$C'_n(X) := \pi_n(X^n, X^{n-1})_{ab}$$

$$d'_n := \pi_n(X^n, X^{n-1})_{ab} \xrightarrow{\partial} \pi_{n-1}(X^{n-1})_{ab} \to \pi_{n-1}(X^{n-1}, X^{n-2})_{ab}$$

is isomorphic to  $C_*(X)$  naturally. Isomorphic:

Naturality directly follows from naturality of Hurewicz morphism.

*Note.* Similarly uniqueness pf ordinary homology theory with coefficient G.

## 3.3 Moore Spaces

**Definition 3.3.** A space X is **Eilenberg-Mac Lane space** of **type** K(G, n) (where G is group and is abelian for  $n \ge 2$ ) if

$$\pi_q(X) \cong \begin{cases} G & n=q \\ 0 & n \neq q \end{cases}$$

We see that SP  $S^n$  is a  $K(\mathbb{Z}, n)$ . Now we use this to construct other K(G, n).

Note. In order to construct K(G, n), we construct a space M(G, n) which have  $\pi_n(M(G, n)) = G$ ,  $\pi_q(M(G, n)) = 0$  for q < n and we can apply SP on it to kill all dim > n homotopy group.

**Proposition 3.13.** For any  $k \in \mathbb{Z}$ , there is a map  $a_k : S^1 \to S^1$  with  $a_k$ , and  $C_{a_k} = S^1 \cup_{a_k} e^2$  is the desired  $M(\mathbb{Z}/k\mathbb{Z}, 1)$  (that is  $SP(S^1 \cup_{a_k} e^2)$  is a  $K(\mathbb{Z}/k\mathbb{Z}, 1)$ ).

**Proof.** Consider sequence  $S^1 \xrightarrow{a_k} S^1 \hookrightarrow C_{a_k} \twoheadrightarrow \Sigma S^1 = C_{a_k}/S^1$ , we apply an usual form of Dold-Thom Theorem to see that  $SP(C_{a_k}) \to SP(S^2)$  is a quasi-fibration with fiber  $SP(S^1)$ . Then we have exact sequence:

$$\cdots \to \pi_q(\operatorname{SP} S^1) \to \pi_q(\operatorname{SP} C_{a_k}) \to \pi_q(\operatorname{SP} S^2) \to \pi_{q-1}(\operatorname{SP} S^1) \to$$
$$\cdots \to \pi_2(\operatorname{SP} S^1) \to \pi_2(\operatorname{SP} C_{a_k}) \to \pi_2(\operatorname{SP} S^2)$$
$$\to \pi_1(\operatorname{SP} S^1) \to \pi_1(\operatorname{SP} C_{a_k}) \to \pi_1(\operatorname{SP} S^2)$$

We can conclude that  $\pi_q(SP C_{a_k}) = 0$  for any  $q \neq 0, 1$  and:

$$0 \to \pi_2(\operatorname{SP} C_{a_k}) \to \pi_2(\operatorname{SP} S^2) = \mathbb{Z} \xrightarrow{\partial} \pi_1(\operatorname{SP} S^1) = \mathbb{Z} \to \pi_1(\operatorname{SP} C_{a_k}) \to 0$$

exact. Where  $\partial$  is defined by:

$$\pi_2(SPS^2) \cong [D^2, S^1, *; SPC_{a_k}, SPS^1, *] \ni f \mapsto f|_{S^1} \in [S^1, S^1]_*$$

(Now we want to show that  $\partial$  is multiplication by k)

The  $1 \in \mathbb{Z} \cong \pi_2(SPS^2)$  is represented by  $[i_2 : S^2 \hookrightarrow SPS^2]$ .

Since  $[D^2, S^1, *; SPC_{a_k}, SPS^1, *] \xrightarrow{p_*} [D^2, S^1; SPS^2, *]$  is isomorphism,

and the map  $\varphi: (D^2, S^1) \xrightarrow{\mathrm{id}_{e^2} \cup a_k} (C_{a_k}, S^1) \hookrightarrow (\operatorname{SP} C_{a_k}, \operatorname{SP} S^1)$  satisfy  $p \circ \varphi = i_2$ , the  $1 \in \mathbb{Z} \cong \pi_2(\operatorname{SP} C_{a_k}, \operatorname{SP} S^1)$  is represented by  $\varphi$ . Then we have  $\partial(1)$  is represented by  $\varphi|_{S^1} = i_1 \circ a_k$  where  $i_1: S^1 \hookrightarrow \operatorname{SP} S^1$ .

The map  $\partial$  is  $\mathbb{Z} \ni n \mapsto kn \in \mathbb{Z}$  since  $[i_1 \circ a_k] = k$ .

Therefore  $\pi_2(\operatorname{SP} C_{a_k}) = 0$  and  $\pi_1(\operatorname{SP} C_{a_k}) = \mathbb{Z}/k\mathbb{Z}$ .

**Proposition 3.14.** For each  $n \ge 1$ ,  $k \in \mathbb{Z}$ ,  $SP(S^n \cup_{\Sigma^{n-1}a_k} e^{n+1})$  is a  $K(\mathbb{Z}/k\mathbb{Z}, n)$ .

**Proof.** For  $q \geq 1$ ,  $\Sigma(S^q \cup_{\Sigma^{q-1}a_k} e^{q+1}) \approx \Sigma S^q \cup_{\Sigma^q a_k} \Sigma e^{q+1} = S^{q+1} \cup_{\Sigma^q a_k} e^{q+2}$  since  $\Sigma$  is left adjoint of  $\Omega$  in  $\mathbf{TOP}_*$  and the pushout is took in  $\mathbf{TOP}_*$ . Observe that  $\pi_q(\mathrm{SP}\,X) \cong \pi_{q+1}(\mathrm{SP}\,\Sigma X)$ , now we have done.

Since  $\tilde{H}_n(X) \cong \tilde{H}_n(X \cup C^*) \cong H_n(X, *)$ , we have

$$\pi_n(\operatorname{SP}(\bigvee_{i\in I}X_i)) = \tilde{H}_n(\bigvee_{i\in I}X_i) \cong H_n(\bigvee_{i\in I}X_i,*) \cong H_n(\coprod_{i\in I}X_i,\coprod_{i\in I}*) \cong \bigoplus_{i\in I}H_n(X_i,*) \cong \bigoplus_{i\in I}\pi_n(\operatorname{SP}X_i)$$

We can deduce the following proposition immediately:

**Proposition 3.15.** For finitely generated abelian group  $G \cong (\bigoplus_r \mathbb{Z}) \oplus (\bigoplus_{1 \leq i \leq k} \mathbb{Z}/d_i\mathbb{Z})$ , (where  $r \in \mathbb{N}$ , each  $d_i \in \mathbb{Z}$ ) we have  $SP((\bigvee_r S^n) \vee (\bigvee_{1 \leq i \leq k} (S^n \cup_{a_{d_i}} e^{n+1})))$  is a K(G, n).

Since every abelian group G have a free resolution sequence:

$$0 \to \bigoplus_{a \in A} \mathbb{Z} \xrightarrow{f} \bigoplus_{b \in B} \mathbb{Z} \twoheadrightarrow G \to 0$$

exact. And for every group  $G = F(X)/\langle Y \rangle_{nor}$  (where  $F(X) := \coprod_{x \in X} \mathbb{Z}_x$  is the free group functor and  $\langle Y \rangle_{nor}$  is the normal subgroup generated by Y), we have:

$$1 \to \coprod_{y \in \langle Y \rangle_{nor}} \mathbb{Z}_y \xrightarrow{f: 1_y \mapsto y} \coprod_{x \in X} \mathbb{Z}_x \twoheadrightarrow G \to 1$$

exact.

Next proposition allows to construct spaces  $M(\bigoplus_{a\in A} \mathbb{Z}, n)$  and  $M(\coprod_{a\in A} \mathbb{Z}, 1)$ :

**Definition 3.4.** For n > 1, G an abelian group, we have exact sequence

$$0 \to \bigoplus_{a \in A} \mathbb{Z} \xrightarrow{f} \bigoplus_{b \in B} \mathbb{Z} \twoheadrightarrow G \to 0$$

Then we have: (with  $\phi$  is the map obtained using lemma 3.8)

$$\bigvee_{a \in A} S_a^n \xrightarrow{\phi} \bigvee_{b \in B} S_b^n \to C_{\phi}$$

the **Moore space** of type (G, n) is defined as  $M(G, n) := C_{\phi}$ .

For n = 1, G a group, we have exact sequence:

$$1 \to \coprod_{y \in \langle Y \rangle_{nor}} \mathbb{Z}_y \xrightarrow{f: 1_y \mapsto y} \coprod_{x \in X} \mathbb{Z}_x \twoheadrightarrow G \to 1$$

Then we have: (with  $\phi$  is the map obtained using lemma 3.8)

$$\bigvee_{y \in \langle Y \rangle_{nor}} S_y^1 \xrightarrow{\phi} \bigvee_{x \in X} S_x^1 \to C_{\phi}$$

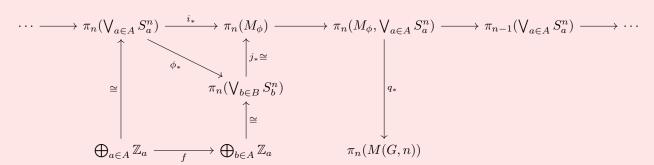

the **Moore space** of type (G,1) is defined as  $M(G,1) := C_{\phi}$ .

Proposition 3.16.  $\pi_n(M(G,n)) = G$ 

**Proof.** For n > 1, use diagram:

To see:

Where  $q_*$  is induced by  $q:(M_\phi,\bigvee_{a\in A}S^n_a)\to (C_\phi,*)$ .  $\bigvee_{a\in A}S^n_a$  is (n-1)-connected, implies  $\pi_{n-1}(\bigvee_{a\in A}S^n_a)=0$ .  $(M_\phi,\bigvee_{a\in A}S^n_a)$  is (n-1)-connected due to lemma 1.13. Therefore we have  $q_*$  is isomorphism using lemma 3.2. Diagram above reduces to:

$$0 \to \bigoplus_{a \in A} \mathbb{Z}_a \xrightarrow{f} \bigoplus_{b \in B} \mathbb{Z}_b \twoheadrightarrow \pi_n(M(G, n)) \to 0$$

For n = 1, use Seifert-van Kampen theorem.

**Proposition 3.17.** For any  $n \geq 1$  and any group morphism  $f: G \to G'$  there exist morphism  $f_M: M(G,n) \to M(G',n)$  such that  $f_{M*} = f$ .

**Proof.** We have following for n > 1: (since free  $\mathbb{Z}$ -module is projective)

$$0 \longrightarrow \bigoplus_{a \in A} \mathbb{Z}_a \xrightarrow{i} \bigoplus_{b \in B} \mathbb{Z}_b \xrightarrow{q} G \longrightarrow 0$$

$$\downarrow r_1 \qquad \qquad \downarrow r_0 \qquad \qquad \downarrow f$$

$$0 \longrightarrow \bigoplus_{a' \in A'} \mathbb{Z}_{a'} \xrightarrow{i'} \bigoplus_{b' \in B'} \mathbb{Z}_{b'} \xrightarrow{q'} G' \longrightarrow 0$$

And we have following for n = 1: (where  $i(1_{1_a 1_b (1_{a \cdot b})^{-1}}) := 1_a 1_b (1_{a \cdot b})^{-1}$ )

$$1 \longrightarrow \coprod_{(a,b)\in(G,G)} \mathbb{Z}_{1_a1_b(1_{a\cdot b})^{-1}} \xrightarrow{i} \coprod_{g\in G} \mathbb{Z}_g \xrightarrow{q} \mathscr{G} \longrightarrow 1$$

$$\downarrow r_1 \qquad \qquad \downarrow r_0 \qquad \qquad \downarrow f$$

$$1 \longrightarrow \coprod_{(a',b')\in(G',G')} \mathbb{Z}_{1'_a1'_b(1_{a'\cdot b'})^{-1}} \xrightarrow{i'} \coprod_{g'\in G'} \mathbb{Z}_{g'} \xrightarrow{q'} \mathscr{G}' \longrightarrow 1$$

We could obtain: (use lemma 3.8)

$$\bigvee_{a \in A} S_a^n \xrightarrow{\phi} \bigvee_{b \in B} S_b^n \xrightarrow{} C_{\phi}$$

$$\downarrow^{\chi_1} \qquad \swarrow \qquad \downarrow^{\chi_0} \qquad \downarrow^{f_M}$$

$$\bigvee_{a' \in A'} S_{a'}^n \xrightarrow{\phi'} \bigvee_{b' \in B'} S_{b'}^n \xrightarrow{} C_{\phi'}$$

Finally we have: (use universal property of cokernel)

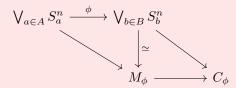

$$0 \longrightarrow \pi_{n}(\bigvee_{a \in A} S_{a}^{n}) \xrightarrow{\phi_{*}=i} \pi_{n}(\bigvee_{b \in B} S_{b}^{n}) \longrightarrow \pi_{n}(C_{\phi}) \longrightarrow 0$$

$$\downarrow^{\chi_{1*}=r_{1}} \qquad \downarrow^{\chi_{0*}=r_{0}} \qquad \downarrow^{f_{M*}=f}$$

$$0 \longrightarrow \pi_{n}(\bigvee_{a' \in A'} S_{a'}^{n}) \xrightarrow{\phi'_{*}=i'} \pi_{n}(\bigvee_{b' \in B'} S_{b'}^{n}) \longrightarrow \pi_{n}(C_{\phi'}) \longrightarrow 0$$

**Theorem 3.18.** SP(M(G, n)) is a K(G, n) if G is abelian.

**Proof.** In the construction of Moore spaces, we have: (use notations in the construction)

which induces quasi-fibration SP  $M_{\phi} \to \text{SP } C_{\phi}$  with fiber SP  $\bigvee_{a \in A} S_a^n$ . Then we have long exact sequence:

$$\cdots \to \pi_q(\operatorname{SP} \bigvee_{a \in A} S_a^n) \xrightarrow{\phi_*} \pi_q(\operatorname{SP} M_\phi) \to \pi_q(\operatorname{SP} C_\phi) \to \pi_{q-1}(\operatorname{SP} \bigvee_{a \in A} S_a^n) \to \cdots$$

Sequence above says if  $q \neq n$  and  $q \neq n + 1$ , then  $\pi_q(SPC_\phi) = 0$ . If q = n + 1, we have:

We have  $\pi_{n+1}(C_{\phi}) = 0$  since  $\phi_*$  is monomorphism.

*Note.* We have two equivalent ways to construct ordinary homology theory with coefficient  $G \in \mathbf{Ab}$  from  $H_n(-,-;\mathbb{Z})$ :

- 1. Tensor cellular chain complex with  $G: C_*(X) \otimes_{\mathbb{Z}} G$  (differentials are  $d_n \otimes \mathrm{id}_G$ )
- 2.  $H_n(X, A; G) := \tilde{H}_n((X \cup CA) \wedge M(G, n))$

Note. Construction of Eilenberg Mac-Lane space using Moore spaces is limited, there is another construction of K(G, n) allows non-abelian group G for n = 1. (use geometric realization)

**Definition 3.5.** The weak product of pointed  $\{Z_i\}_{i\in Z}$  spaces is

$$\prod_{i\in\mathbb{N}} Z_i := \lim_{S\in\operatorname{Fin}(\mathbb{N})} (\prod_{i\in S} Z_i)$$

whose underlying set is:

$$\{(a_i)_{i\in\mathbb{N}}\in\prod_{i\in\mathbb{N}}Z_i\mid \text{only finite }a_i\text{ is not }*\}$$

Theorem following shows why K(G, n) is important:

**Theorem 3.19.** If Y is a path-connected commutative associative H-space with strict identity  $(1 \cdot y = y)$ , then there is a weak equivalence

$$\prod_{n>1}^{\circ} K(\pi_n(Y), n) \to Y$$

Moreover, we have weak equivalence

$$\prod_{n>1} K(\pi_n(Y), n) \to Y$$

**Proof.** Take free resolution of  $\pi_n(Y)$ 

$$0 \to \bigoplus_{a \in A} \mathbb{Z}_a \xrightarrow{\gamma} \bigoplus_{b \in B} \mathbb{Z}_b \xrightarrow{q} \pi_n(Y) \to 0$$

(for n = 1, replace  $\bigoplus$  with  $\coprod$ ). and obtain:

$$\bigvee_{a \in A} S_a^n \xrightarrow{\phi} \bigvee_{b \in B} S_b^n \xrightarrow{C_{\phi}} C_{\phi} \cong M(\pi_n(Y, n))$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow \downarrow \qquad \qquad \downarrow f'_n$$

$$\downarrow \qquad \qquad \downarrow f'_n$$

where  $[g_b'] = q(1_b)$ . We have  $f_{n*}' : \pi_n(M(\pi_n(Y), n)) \to \pi_n(Y)$  is an isomorphism. Construct  $f_n'^k : \prod_k M(\pi_n(Y), n) \to Y$  by:

$$f_n'^k : \prod_k M(\pi_n(Y), n) \to Y$$
  
 $(a_1, a_2, \dots, a_k) \mapsto f(a_1) \cdot f(a_2) \cdots f(a_k)$ 

where  $-\cdot -: Y \times Y \to Y$  is the *H*-multiplication on *Y*.

Strict identity, commutativity and associativity says it is homotopically unique rel\*.

Therefore we have a well-defined map  $f_n^k : \operatorname{SP}^k M(\pi_n(Y), n) \to Y$  (for each k) which commutes with inclusion  $\operatorname{SP}^k \hookrightarrow \operatorname{SP}^{k+1}$ .

Directly from above, we have  $f_n: SPM(\pi_n(Y), n) \to Y$  induces isomorphism on  $\pi_n(-)$ . (in case  $n = 1, \pi_1(Y)$  is abelian since Y is a commutative H-space)

Similarly we have  $f: SP(\bigvee_n M(\pi_n(Y), n)) \to Y$  obtained from  $\bigvee_n f'_n: \bigvee_n M(\pi_n(Y), n) \to Y$ .

 $\operatorname{SP}(\bigvee_n M(\pi_n(Y), n)) \approx \prod_n \operatorname{SP} M(\pi_n(Y), n)$  since we have  $\operatorname{SP}(X_1 \vee X_2) \approx \operatorname{SP} X_1 \times \operatorname{SP} X_2$  and  $\operatorname{SP}$  commute with directed colimit. We can deduce that  $f|_{\operatorname{SP} M(\pi_n(Y), n)} = f_n$  from construction of the homeomorphism.

Last,  $\prod_{n\geq 1} K(\pi_n(Y), n) \hookrightarrow \prod_{n\geq 1} K(\pi_n(Y), n)$  is weak homotopy equivalence since  $S^n$  have compact image. (is homotopy equivalence since they are CW-complexes)

**Corollary 3.20.** If Y is a space, then there is a weak equivalence

$$\prod_{n\geq 1}^{\circ} K(H_n(Y), n) \to \operatorname{SP} Y$$

Moreover, we have weak equivalence

$$\prod_{n\geq 1} K(H_n(Y), n) \to \operatorname{SP} Y$$

# Cohomology and Spectra

#### Axiom for Cohomology and reduced Cohomology 4.1

**Definition 4.1.** An Unreduced Generalized Cohomology Theory  $(E^*, \delta)$  is a functor to the category of  $\mathbb{Z}$ -graded abelian groups:

$$E^*(-,-): \mathbf{TOP_{CW}(2)}^{\mathrm{op}} \to \mathbf{Ab}^{\mathbb{Z}},$$

with a natural transformation of degree +1:

 $\delta_{n,(X,A)}: E^n(A,\emptyset) \to E^{n+1}(X,A)$  (called connecting homomorphism) satisfying following 3 axioms:

#### • Homotopy Invariance:

Homotopy equivalence of pairs  $f:(X,A)\to (Y,B)$  induces isomorphism

$$E^*(f): E^*(Y, B) \to E^*(X, A)$$

#### • Long Exact Sequence:

Map  $A \hookrightarrow X$  induces a long exact sequence together with  $\delta$ :

$$\cdots E^n(X,A) \to E^n(X) \to E^n(A) \xrightarrow{\delta} E^{n+1}(X,A) \to \cdots$$

where  $E^n(X) := E^n(X, \emptyset)$ .

#### • Excision:

If (X; A, B) is an **excisive triad** (that is,  $X = A \cup B$ ), then inclusion  $(A, A \cap B) \hookrightarrow (X, B)$ induces isomorphism

$$E^*(A, A \cap B) \cong E^*(X, B)$$

We say  $(E^*, \delta)$  is **additive** if in addition:

#### • Additivity:

If  $(X, A) = \coprod_{\lambda} (X_{\lambda}, A_{\lambda})$  in  $\mathbf{TOP_{CW}(2)}$ , then inclusions  $i_{\lambda} : (X_{\lambda}, A_{\lambda}) \to (X, A)$  induces isomorphism

$$(\prod i_{*,\lambda}): E^*(X,A) \cong \prod E^*(X_\lambda,A_\lambda)$$

We say  $(E^*, \delta)$  is **ordinary** if  $(E^*, \delta)$  satisfy all axioms above and:

#### • Dimension:

$$E^{*\neq 0}(*,\emptyset) = 0$$

 $E^{*\neq 0}(*,\emptyset)=0$  An unreduced ordinary cohomology theory is called with coefficient G if  $E^0(*,\emptyset)=G$ .

**Definition 4.2.** An Reduced Generalized Cohomology Theory  $(\tilde{E}^*, \sigma)$  is a functor from opposite of category of pointed CW-complexes to the category of  $\mathbb{Z}$ -graded abelian groups:  $\tilde{E}^*(-): \mathbf{TOP}^{*/}_{\mathbf{CW}} \xrightarrow{\mathrm{op}} \mathbf{Ab}^{\mathbb{Z}},$ 

$$\tilde{E}^*(-): \mathbf{TOP}^{*/\text{op}}_{\mathbf{CW}} o \mathbf{Ab}^{\mathbb{Z}}$$

with a natural isomorphism of degree +1:

 $\sigma: \tilde{E}^*(-) \cong \tilde{E}^{*+1}(\Sigma(-))$  (called suspension isomorphism)

satisfying following 2 axioms:

#### • Homotopy Invariance:

Homotopic pointed maps  $f, g: X \to Y$  induces same map:

$$\tilde{E}^*(f) = \tilde{E}^*(g) : \tilde{E}^*(Y) \to \tilde{E}^*(X)$$

#### • Exactness:

Pointed map  $i: A \hookrightarrow X$  and  $j: X \hookrightarrow C_i$  gives a exact sequence in  $\mathbf{Ab}^{\mathbb{Z}}$ 

$$\tilde{E}(C_i) \xrightarrow{\tilde{E}^*(j)} \tilde{E}^*(X) \xrightarrow{\tilde{E}^*(j)} \tilde{E}^*(A)$$
 We say  $(\tilde{E}^*, \sigma)$  is additive if in addition:  
• Wedge Axiom:

#### • Wedge Axiom:

The canonical comparison morphism (induced by morphisms  $X_i \hookrightarrow \bigvee_i X_i$ )

$$\tilde{E}^*(\bigvee_i X_i) \to \prod_i \tilde{E}^*(X_i)$$

is isomorphism.

We say  $(\tilde{E}^*, \sigma)$  is **ordinary** if  $(\tilde{E}^*, \sigma)$  satisfy all axioms above and:

#### • Dimension:

$$\tilde{E}^{*\neq 0}(S^0) = 0$$

 $\tilde{E}^{*\neq 0}(S^0) = 0$  A reduced ordinary cohomology theory is called with coefficient G if  $\tilde{E}^0(S^0) = G$ .

*Note.* They are related to each other by  $E^*(X,A) := \tilde{E}^*(X \cup CA)$  and  $\tilde{E}^* := E^*(X,*)$ . (proof is omitted)

## 4.2 Brown Representability Theorem

We will prove that any additive reduced cohomology theory is naturally isomorphic to some  $[-,Y]_*$ .

**Definition 4.3.**  $C_0 := \text{Ho}(C)$ , where C is category of path-connected pointed CW-complexes.

**Definition 4.4.** A weak limit/colimit is just ordinary limit/colimit without the uniqueness its in universal property.

**Lemma 4.1.**  $C_0$  have weak coequalizers

**Proof.** If we have map  $f, g: A \to X$  in  $C_0$  then define  $Z:=X_1 \cup_f (A \times I) \cup_g X_2/(x,0) \sim (x,1)$  where  $X_1 = X \times \{0\}, X_2 = X \times \{1\}$ .  $j: X \hookrightarrow Z$  is the weak coequalizer map.  $i: A \times I \hookrightarrow Z$  is the homotopy  $j \circ f \simeq j \circ g$ .

For  $s: X \to Y$  such that there is  $h: s \circ f \simeq s \circ g$ , we have  $s \cup h \cup s: X_1 \cup_f (A \times I) \cup_g X_2 \to Y$ , and it defines a map  $s': Z \to Y$  such that  $s' \circ j = s$ .

**Lemma 4.2.** Suppose  $\{Y_n\}_{n\in\mathbb{N}}$  is a sequence of objects in  $C_0$  with for all  $n\in\mathbb{N}$ ,  $i_n:Y_n\hookrightarrow Y_{n+1}$  is cofibration.

Let  $Y := \underline{\lim}_n Y_n$ , then there is coequalizer diagram:

$$\bigvee_{n} Y_{n} \xrightarrow[\bigvee_{n} \operatorname{id}_{Y_{n}}]{\operatorname{id}_{Y_{n}}} \bigvee_{n} Y_{n} \xrightarrow{\bigvee_{n} j_{n}} Y$$

where  $j_n: Y_n \hookrightarrow Y_{n+1} \hookrightarrow Y$ .

**Proof.**  $j_{n+1} \circ i_n = j_n \circ \mathrm{id}_{Y_n}$ , and if we have  $g : \bigvee_n Y_n \to Z$  such that  $g \circ \bigvee_n i_n \simeq g \circ \bigvee_n \mathrm{id}_{Y_n}$ . Define  $g_n := g|_{Y_n}$ , use induction on n and HEP of cofibration, we have  $g'_n \simeq g_n$  such that  $g'_{n+1} \circ i_n = g'_n$ , there data together defines a  $g' : Y \to Z$  satisfy desired properties.

**Definition 4.5.** A **Brown functor** is a functor  $H: C_0^{\text{op}} \to \mathbf{Set}^{*/}$  send coproducts to products, weak coequalizers to weak equalizers:

$$H(\bigvee_i X_i) \cong \prod_i H(X_i)$$

If  $j: X \to Z$  is coequalizer of  $f, g: A \to X$ ,

then  $H(j): H(Z) \to H(X)$  is equalizer of  $H(f), H(g): H(X) \to H(A)$ .

*Note.* Every additive reduced cohomology theory  $\tilde{E}^n(-): \mathbf{TOP_{CW}^{*/}}^{\mathrm{op}} \to \mathbf{Ab} \to \mathbf{Set}^{*/}$  is equivalent to a Brown functor.

**Definition 4.6.** Any  $u \in H(Y)$  determine a natural transformation  $T_u : [-,Y]_* \to H(-)$  by

$$[X,Y]\ni f \longmapsto H(f)(u)\in H(X)$$
 
$$\downarrow \qquad \qquad \downarrow$$
 
$$[X',Y]\ni f\circ a \longmapsto H(f\circ a)(u)\in H(X')$$

where  $a \in [X', X]$ .

 $u \in H(Y)$  is n-universal  $(n \ge 1)$  if  $T_{u,S^q} : [S^q,Y]_* \to H(S^q)$  is isomorphism for  $1 \le q \le n-1$  and epimorphism for q=n.

 $u \in H(Y)$  is **universal** if u is n-universal forall  $n \ge 1$ .

Y is called an **classifying space** for H if there exists  $u \in H(Y)$  that is universal.

**Lemma 4.3.** If H is a Brown functor,  $Y,Y' \in C_0$ ,  $u \in H(Y)$ ,  $u' \in H(Y')$  are universal, and there is a map  $f: Y \to Y'$  such that H(f)(u') = u, then f is a weak equivalence.

**Proof.** Directly from  $T_{u,S^q}$ ,  $T_{u',S^q}$  are isomorphisms:

$$\pi_{q}(Y) \xrightarrow{f_{*}} \pi_{q}(Y')$$

$$\downarrow^{T_{u',S^{q}}}$$

$$H(S^{q})$$

**Lemma 4.4.** If H is a Brown functor,  $Y \in C_0$  and  $u \in H(Y)$ , then there exists  $Y' \in C_0$  obtained from Y by attaching 1-cells, and a 1-universal element  $u' \in H(Y')$  such that  $H(i)(u') = u \in H(Y)$ . (where  $i: Y \hookrightarrow Y'$ )

**Proof.** Let  $Y' := Y \vee (\bigvee_{a \in H(Y)} S_a^1)$ , H(i) is just projection:

$$H(Y') \cong (H(Y) \times \prod_{a \in H(S^1)} H(S_a^1)) \to H(Y).$$

Let  $g_a := S^1 \approx S_a^1 \hookrightarrow Y'$ ,

 $u' := (u, \prod_a a) \in H(Y) \times H(\bigvee_{a \in H(S^1)} S_a^1).$ 

 $T_{u',S^1}:[S^1,Y']_*\to H(S^1)$  is epimorphism since  $H(g_a)(u')=a\in H(S^1)$ .

**Lemma 4.5.** If H is a Brown functor,  $Y \in C_0$  and  $u \in H(Y)$  is n-universal  $(n \ge 1)$ , then there exists  $Y' \in C_0$  obtained from Y by attaching (n+1)-cells, and a (n+1)-universal element  $u' \in H(Y')$  such that  $H(i)(u') = u \in H(Y)$ . (where  $i: Y \hookrightarrow Y'$ )

**Proof.** Let  $K := \ker(T_{u,S^n})$ , we have:

$$* \to K \hookrightarrow [S^n, Y]_* \xrightarrow{T_{u, S^n}} H(S^n) \to *$$

Let  $Y_1 := Y \vee (\bigvee_{i \in H(S^{n+1})} S_i^{n+1})$ . We notice a cofib sequence:

$$\bigvee_{k \in K} S_k^n \xrightarrow{f} Y_1 \to C_f$$

where  $f := \bigvee_{k \in K} k$ . Let  $Y' := C_f$ .

 $u_1 := (u, \prod_{a \in H(S^{n+1})} a) \in H(Y_1)$  where  $g_a := S^{n+1} \approx S_a^{n+1} \hookrightarrow Y_1$ . The cofib sequence is just a weak coequalizer diagram in  $C_0$ :

$$\bigvee_{k \in K} S_k^n \xrightarrow{f} Y_1 \longrightarrow Y'$$

Apply H on it:

$$H(Y') \longrightarrow H(Y_1) \Longrightarrow H(\bigvee_{k \in K} S_k^n)$$

We have  $H(f)(u_1) = \prod_{k \in K} H(k)(u_1) = \prod_{k \in K} H(k)(u) = \prod_{k \in K} T_{u,S^n}(k) = 0 = H(0)(u_1)$ . By definition of weak equalizer, there exists  $u' \in H(Y')$  such that  $H(i)(u') = u \in H(Y)$ .  $(i:Y \hookrightarrow H(Y))$ Y')

Verify that u' is (n+1)-universal:

 $T_{u',S^{n+1}}$  is epimorphism since  $T_{u',S^{n+1}}(i_1 \circ g_a) = T_{u_1,S^{n+1}}(g_a) = a \in H(S^{n+1})$ .

Current goal is to prove  $T_{u',S^q}$ ,  $q \leq n$  are isomorphisms.

We have commutative diagram:

And we notice that  $\pi_q(Y',Y)=0$  for  $q\leq n$ . Then we have  $T_{u,S^q}$  is isomorphism for q < n and epimorphism for q = n implies that

 $T_{u',S^q}$  is isomorphism for q < n and epimorphism for q = n. For any  $k \in K \hookrightarrow \pi_n(Y)$ ,  $i \circ k = 0 \in \pi_n(Y')$ . That is,  $K \subseteq \ker(i_*)$ . And we also have  $\ker(i_*) \subseteq K$ , since  $T_{u',S^n} \circ i_* = T_{u,S^n}$ .  $\ker(i_*) = K := \ker(T_{u,S^n})$  implies that  $T_{u',S^n}$  is isomorphism.

**Theorem 4.6.** H is a Brown functor,  $Y \in C_0$  and  $u \in H(Y)$  then there is a classifying space Y' for H such that (Y',Y) is a relative CW-complex and the universal element  $u' \in H(Y')$  satisfying H(i)(u') = u.  $(i:Y \hookrightarrow Y')$ 

**Proof.** Construct spaces  $\{Y_n\}_{n\in\mathbb{N}}$  and  $u_n\in H(Y_n)$  as following:

- 1.  $Y_0 := Y$ ,  $u_0 := u$
- 2.  $Y_1, u_1$  is obtained from lemma 4.4.
- 3. Use lemma 4.5 to construct  $Y_{n+1}, u_{n+1}$  from  $Y_n, u_n$ .

Let  $Y' := \underline{\lim} \{Y_0 \hookrightarrow \cdots \hookrightarrow Y_n \hookrightarrow Y_{n+1} \hookrightarrow \cdots\}$  then we have weak equalizer diagram:

$$H(Y') \longrightarrow \prod_n H(Y_n) \xrightarrow[n \in \mathbb{N}]{} H(id_{Y_n}) \xrightarrow[n \in \mathbb{N}]{} H(Y_n)$$

and

$$(\prod_{n\in\mathbb{N}}H(i_n))(\prod_{n\in\mathbb{N}}u_n)=\prod_{n\in\mathbb{N}}u_n=\prod_{n\in\mathbb{N}}H(\mathrm{id}_{Y_n})(\prod_{n\in\mathbb{N}}u_n)$$

(by  $H(i_n)(u_{n+1}) = u_n$ ) Then there exists  $u' \in H(Y')$  satisfying  $\forall n \in \mathbb{N}, H(j_n) = u_n$ . (where  $j_n : Y_n \hookrightarrow Y'$ )

Verify that u' is universal:

(The isomorphisms in diagram are  $T_{u_{q+1},S^q},\ T_{u_{q+2},S^q},\ T_{u',S^q}).$ 

Corollary 4.7. For any Brown functor H, there exist classifying spaces for H which are CW complexes.

**Proof.** Use theorem 4.6 with Y = \*.

**Lemma 4.8.** H is a Brown functor,  $u \in H(Y)$  is a universal element,  $i : A \hookrightarrow X$  is a relative CW-complex. Given map  $g : A \to Y$  and  $v \in H(X)$  satisfy:

$$H(X)\ni v$$
 
$$\downarrow$$
 
$$H(Y)\ni u \longrightarrow H(A)\ni H(g)(u)=H(i)(v)$$

Then exists map  $g': X \to Y$  such that  $g'|_A = g$  and diagram:

$$H(X) \ni v = H(g')(u)$$

$$\downarrow$$

$$H(Y) \ni u \longrightarrow H(A)$$

commutes.

**Proof.** Let (Z, j) be weak coequalizer of the diagram:

$$A \xrightarrow{i} X$$

$$g \downarrow \qquad \qquad \downarrow_{i_1}$$

$$Y \xrightarrow{i_2} X \vee Y$$

then we have weak equalizer diagram:

$$H(Z) \longrightarrow H(X) \times H(Y) \xrightarrow[H(i_2 \circ g)]{H(i_1 \circ i)} H(A)$$

We also have

$$H(A) \xleftarrow{H(i)} H(X)$$

$$H(g) \uparrow \qquad \qquad \uparrow_{p_1 = H(i_1)}$$

$$H(Y) \xleftarrow{p_2 = H(i_2)} H(X) \times H(Y)$$

which implies  $H(i) \circ H(i_1)(v, u) = H(i)(v) = H(g)(u) = H(g) \circ H(i_2)(v, u)$ .

Then there is a element  $u^+ \in H(Z)$  such that  $H(j)(u^+) = (v, u)$ . Use theorem 4.6 to obtain relative CW-complex (Z', Z) and universal element  $u' \in H(Z')$  such that  $H(i_Z)(u') = u^+$ .  $(i_Z : Z \hookrightarrow Z')$  By lemma 4.3,  $j' := i_Z \circ j \circ i_2 : Y \hookrightarrow X \vee Y \hookrightarrow Z \hookrightarrow Z'$  is a weak equivalence. We also have diagram in  $\mathbf{TOP_{CW}^{*/}}$ : (since (Z, j) is weak coequalizer in  $C_0$ )

$$A \stackrel{i}{\smile} X$$

$$g \downarrow \qquad \downarrow i_Z \circ j \circ i_1$$

$$Y \stackrel{j'}{\longrightarrow} Z'$$

Apply HELP:

$$\begin{array}{ccc}
A & \xrightarrow{i} & X \\
g & \downarrow & \downarrow \\
f & \swarrow & \downarrow \\
Y & \xrightarrow{i'} & Z'
\end{array}$$

and verify that  $H(g')(u) = H(g') \circ H(j')(u') = H(i_Z \circ j \circ i_1)u' = H(i_1) \circ H(j)(u^+) = H(i_1)(v, u) = v.$ 

**Theorem 4.9.** If Y is a classifying space for a Brown functor H and  $u \in H(Y)$  is a universal element, then  $T_u : [-,Y] \to H(-)$  is a natural isomorphism.

**Proof.**  $T_{u,X}$  is epimorphism:

For  $v \in H(X)$ , use lemma 4.8 with (X,A) := (X,\*) to obtain a map  $g': X \to Y$  such that  $T_{u,X}(g') = H(g')(u) = v$ .

 $T_{u,X}$  is monomorphism:

Let  $f_0, f_1: X \to Y$  such that  $T_{u,X}(f_1) = T_{u,X}(f_2)$ .

Define CW-complex  $X' := X \times I/\{*\} \times I$  with CW-structure  $X'^q = (X^q \times \partial I \cup X^{q-1} \times I)/\{*\} \times I$  for  $q \ge 0$ .

Define  $h: X' \to X$  by  $\overline{(x,t)} \mapsto x$  and define  $v \in H(X')$  by  $v = H(f_0 \circ h)(u)$ .

Let  $A' := X \vee X = X \times \partial I/\{*\} \times \partial I$ ,  $i : A' \hookrightarrow X'$  and define  $f : A' \to Y$  by  $(a, 0) \mapsto f_0(a)$ ,  $(a, 1) \mapsto f_1(a)$ . Then we have  $H(f)(u) = (H(f_0)(u), H(f_1)(u)) = (H(f_0)(u), H(f_0)(u)) = H(f_0 \circ h \circ i)(u) = H(i)(v)$ . Use lemma 4.8 with (X, A) = (X', A') to obtain a  $f' : X' \to Y$  such that  $f'|_{A'} = f$  and H(f')(u) = v.

 $h: X \times I \to X' \xrightarrow{f'} Y$  is the desired homotopy  $g_0 \simeq g_1$ .

**Corollary 4.10.** If Y, Y' are classifying spaces of a Brown functor H, and  $u \in H(Y), u' \in H(Y')$  are their universal elements, then there is a homotopy equivalence  $f: Y \to Y$  which is unique up to homotopy and satisfy H(f)(u') = u.

**Proof.** By theorem 4.9,  $T_{u',Y}:[Y,Y']\to H(Y)$  is isomorphism. Then there is unique f:[Y,Y'] such that  $T_{u',Y}(f)=u$ . (notice that  $T_{u',Y}(f)=H(f)(u')$ ) By lemma 4.3 and theorem 1.9, f is homotopy equivalence.

Definition 4.7. A sequential pre-spectrum in topological spaces is:

- A N-graded compactly generated space :  $X_* := \{X_n \in \mathbf{TOP_{CG}^*}\}_{n \in \mathbb{N}}$ .
- Structure maps :  $\{\sigma_n : \Sigma X_n \to X_{n+1}\}_{n \in \mathbb{N}}$ .

Map between sequential pre-spectra is map between  $\mathbb{N}$ -graded spaces  $f_n: X_n \to Y_n$  such that

$$\Sigma X_n \xrightarrow{\Sigma f_n} \Sigma Y_n$$

$$\sigma_n \downarrow \qquad \qquad \downarrow \sigma'_n$$

$$X_{n+1} \xrightarrow{f_{n+1}} Y_{n+1}$$

commutes.

An  $\Omega$ -prespectrum is a sequential spectrum  $X_*$  with adjoints of structure maps  $\sigma_n: X_n \to \Omega X_{n+1}$  are weak equivalences.

For an  $\Omega$ -prespectrum  $X_*$ , we can extend it into a  $\mathbb{Z}$ -graded space by setting  $X_{-n} := \Omega^n X_0$ .

**Theorem 4.11.** If  $(\tilde{E}^*, \sigma)$  is a reduced additive cohomology theory, then there exist homotopically unique  $\Omega$ -prespectrum  $Y_*$  (each  $Y_n$  is a CW-complex) such that  $E^n(-) \cong [-, Y_n]_*$  naturally. (naturality implies diagram below commutes)

$$\tilde{E}^{n}(-) \longrightarrow [-, Y_{n}]_{*}$$

$$\downarrow \qquad \qquad \downarrow$$

$$\tilde{E}^{n+1}(\Sigma(-)) \longrightarrow [\Sigma(-), Y_{n+1}]_{*} \cong [-, \Omega Y_{n+1}]_{*}$$

If  $Y_*$  is an  $\Omega$ -prespectrum, then  $\tilde{E}^n := [-, Y_n]_*$ ,  $\sigma_n : [-, Y_n]_* \to [-, \Omega Y_{n+1}] \cong [\Sigma(-), Y_{n+1}]$  is a reduced additive cohomology theory.

**Definition 4.8.** For an abelian group A, the **Eilenberg-Mac Lane prespectrum**  $KA_*$  is defined by  $KA_n := K(A, n)$ . Structure maps is  $KA_n \to M \to \Omega KA_{n+1}$  where M is a CW-approximation of  $\Omega KA_{n+1}$ , and homotopy equivalence  $KA_n \to M$  is obtained from corollary 4.10.

**Proposition 4.12.** If a reduced additive cohomology theory  $\tilde{H}^*, \sigma$  is ordinary, then  $\tilde{H}^n(-) \cong [-, KA_n]_*$  naturally.

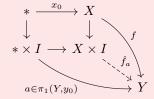

Proof.

# 5 Towers And Homotopy Limits

## 5.1 Pointed and Unpointed Homotopy Classes

**Proposition 5.1.** There are pointed spaces  $X, Y \in \mathbf{TOP}^{*/}$ , if X is well-pointed, then there is a right action of  $\pi_1(Y, y_0)$  on  $[X, Y]_*$ .

**Proof.** The right action is given by:  $[f] \cdot [a] := [\hat{f}_{a,1}]$  where  $\hat{f}_{a,1} := \hat{f}_a(-,1)$ 

Verify it is well-defined:

By the property of closed cofibration,  $\hat{f}_a$  is unique up to homotopy, hence independent from choice of  $a \in [a]$  and  $f \in [f]$ .

Verify it is an group action:

If e is the constant loop in  $\pi_1(Y, y_0)$ , then  $\hat{f}_e(x, t) = f(x)$ .

If  $[a], [b] \in \pi_1(Y, y_0)$  then  $[f] \cdot [a] = [\hat{f}_{a,1}], ([f] \cdot [a]) \cdot [b] = [(\hat{a}, f_{0,1}])$ . define

$$h: X \times I \to Y$$
 
$$(x,t) \mapsto \begin{cases} \hat{f}_a(x,2t) & t \le 1/2 \\ \hat{f}_{a,1})_b(x,2t-1) & t \ge 1/2 \end{cases}$$

Since 
$$h(-,0) = f$$
,  $h(x_0,-) = a \cdot b$   $h \simeq \hat{f}_{a \cdot b}$ .  $[f] \cdot ([a] \cdot [b]) = [\hat{f}_{a \cdot b}(-,1)] = [h(-,1)] = ([f] \cdot [a]) \cdot [b]$ .

**Theorem 5.2.** If  $X,Y \in \mathbf{TOP}^{*/}$  there is a forgetful map  $\phi : [X,Y]_* \to [X,Y]$  where [X,Y] is the **free** homotopy class of (not necessarily pointed) maps  $X \to Y$ . If  $(X,x_0)$  is well-pointed and Y is path-connected, then  $\phi$  induces bijection  $\overline{\phi} : [X,Y]_*/\pi_1(Y,y_0) \cong [X,Y]$ .

**Proof.**  $\overline{\phi}$  is well-defined:

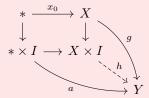

For any  $a \in \pi_1(Y, y_0)$ , f is freely homotopic to  $\hat{f}_a(-, 1)$ .

 $\overline{\phi}$  is injective:

If we have  $\phi([f]) = \phi([g])$  which means there is free homotopy  $h: f \simeq g$ , let  $a := h(x_0, -)$ , then  $h \simeq \hat{f}_a$ ,  $[f] \cdot [a] = [h(-, 1)] = [g]$ .

 $\overline{\phi}$  is surjective:

Suppose  $g \in \text{Hom}_{\mathbf{TOP}}(X,Y)$  is an unpointed map, choose a path  $a: g(x_0) \simeq y_0$ , extend a, g:

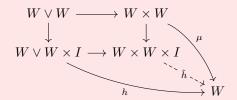

$$\phi([h(-,1)]) = [g].$$

**Theorem 5.3.** If (W, e) is a well-pointed H-space,  $\mu : W \times W \to W$  is its H-multiplication. Then  $\mu$  is homotopic to another H-multiplication  $\mu'$  such that  $\mu'(-, e) = \mathrm{id}_W = \mu'(e, -)$  is strict identity.

**Proof.** Let  $l := \mu \circ (e, \mathrm{id}_W) \simeq \mathrm{id}_W$ ,  $r := \mu \circ (\mathrm{id}_W, e) \simeq \mathrm{id}_W$ ,

$$h: W \vee W \times I \to W$$
 
$$(w, e, t) \mapsto r(w, t)$$
 
$$(e, w, t) \mapsto l(w, t)$$

Then we have diagram: (since  $W \vee W \to W \times W$  is cofib)

$$\mu' := \hat{h}(-, -, 1).$$

**Proposition 5.4.** If  $(X, x_0)$  is well-pointed space, (W, e) is a well-pointed H-space, then  $\pi_1(W, e)$  acts trivially on  $[X, W]_*$ 

**Proof.** For  $[f] \in [X, W]_*$ ,  $a \in \pi_1(W, e)$  define

$$h: X \times I \to W$$
  
 $(x,t) \mapsto \mu'(f(x), a(t))$ 

$$[f] \cdot [a] = [h(-,1)] = [f]$$
 since  $h \simeq \hat{f}_a$ .

**Corollary 5.5.** If  $(X, x_0)$  is well-pointed space, (Y, e) is a well-pointed path-connected H-space, then  $\phi : [X, Y]_* \to [X, Y]$  is a bijection.

**Theorem 5.6.**  $X \in \mathbf{TOP}$ ,  $\pi_{\leq 1}(X)$  is the fundamental groupoid of X there are functors

$$\Psi_n : \pi_{\leq 1}(X) \to \mathbf{Grp}$$

$$x_0 \mapsto \pi_n(X, x_0)$$

$$\mathrm{Hom}_{\pi_{\leq 1}(X)}(x_0, x_1) \ni [a] \mapsto ([S^n, X]_* \ni [f] \mapsto [\hat{f}_a(-, 1)])$$

with property : for every  $f: X \to Y, [a] \in \operatorname{Hom}_{\pi_{<1}(X)}(x_0, x_1)$  diagram

$$\pi_n(X, x_0) \xrightarrow{\Psi_n(a)} \pi_n(X, x_1)$$

$$f_* \downarrow \qquad \qquad \downarrow f_*$$

$$\pi_n(Y, f(x_0)) \xrightarrow{\Psi_n(f \circ a)} \pi_n(Y, f(x_1))$$

commutes.

**Lemma 5.7.** Assume X, Y, Z are path-connected and well-pointed. Consider functor  $[-, Z]_*$  apply on Barratt-Puppe sequence

$$\cdots \to [\Sigma Y, Z]_* \xrightarrow{\Sigma f^*} [\Sigma X, Z]_* \xrightarrow{q^*} [C_f, Z]_* \xrightarrow{i^*} [Y, Z]_* \xrightarrow{f^*} [X, Z]_*$$

The sequence is exact (in category  $\mathbf{Set}^{*}$ ), and we have following by exactness:

- 1.  $[\Sigma X, Z]_*$  acts from right on  $[C_f, Z]_*$ .
- 2.  $q^*: [\Sigma X, Z]_* \to [C_f, Z]_*$  is a map between right  $[\Sigma X, Z]_*$ -sets.
- 3.  $q^*([x]) = q^*([x'])$  iff exists some  $[y] \in [\Sigma Y, Z]_*$  such that  $[x] = \Sigma f^*([y]) \cdot [x']$ .
- 4.  $i^*([z]) = i^*([z'])$  iff exists some  $[x] \in [\Sigma X, Z]_*$  such that  $[z] = [z'] \cdot [x]$ .
- 5.  $\operatorname{Im}(\Sigma q^* : [\Sigma^2 X, Z]_* \to [\Sigma C_f, Z]_*)$  is central subgroup of  $[\Sigma C_f, Z]_*$ .

**Proof.** 1. Define h-coaction map:

$$\begin{split} u_f: C_f &\to C_f \vee \Sigma X \\ (y,0) &\mapsto (y,0) \\ \hline \overline{(x,t)} &\mapsto \begin{cases} \overline{(x,2t)} \in C_f & t \leq 1/2 \\ \overline{(x,2t-1)} \in \Sigma X & t \geq 1/2 \end{cases} \end{split}$$

2.

$$C_f \xrightarrow{q} \Sigma X$$

$$\downarrow^{u_f} \downarrow \qquad \qquad \downarrow^{u_{X \to *}}$$

$$C_f \vee \Sigma X_q \xrightarrow{\text{vid}_{\Sigma X}} \Sigma X \vee \Sigma X$$

3.  $q^*([x]) = q^*([x']) \Leftrightarrow q^*([x] \cdot [x']^{-1}) = * \Leftrightarrow \text{there exists some } [y] \in [\Sigma Y, Z]_* \text{ such that } [x] \cdot [x']^{-1} = \Sigma f^*(y).$ 

4. If  $i^*([z]) = i^*([z'])$ , then there are maps  $c \simeq z$ ,  $c' \simeq z'$  such that  $c|_Y = c'|_Y$ . (use HEP)

$$x: \Sigma X \to Z$$

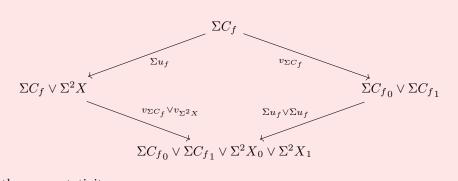

$$\overline{(x,t)} \mapsto \begin{cases} c'(x, 1-2t) & t \le 1/2 \\ c(x, 2t-1) & t \ge 1/2 \end{cases}$$

we have  $[c] = [c'] \cdot [x]$ .

5. Let  $G := [\Sigma C_f, Z]$ ,  $H := \operatorname{Im}(\Sigma q^*)$ .  $\Sigma u_f$  gives the right action  $\star$  of H on G. It is different from the usual product  $\cdot$  (given by  $v_{\Sigma C_f}$ ) on G:

$$\begin{split} v_{\Sigma C_f} : \Sigma C_f &\to \Sigma C_{f_0} \vee \Sigma C_{f_1} \\ (c,t) &\mapsto \begin{cases} (c,2t)_0 & t \leq 1/2 \\ (c,2t-1)_1 & t \geq 1/2 \end{cases} \\ \Sigma u_f : \Sigma C_f &\to \Sigma C_f \vee \Sigma^2 X \\ \hline (y,0,t) &\mapsto \overline{(y,0,t)} \\ \hline (x,s,t) &\mapsto \begin{cases} \overline{(x,2s,t)} \in \Sigma C_f & s \leq 1/2 \\ \overline{(x,2s-1,t)} \in \Sigma^2 X & s \geq 1/2 \end{cases} \end{split}$$

And we have  $(g \star h) \cdot (g' \star h') = (g \cdot g') \star (h \cdot h')$ , which is equivalent to commutativity of diagram below.

Verify the commutativity:

$$\begin{split} &C_f \to \Sigma C_{f_0} \vee \Sigma C_{f_1} \vee \Sigma^2 X_0 \vee \Sigma^2 X_1 \\ &\overline{(y,0,t)} \mapsto \begin{cases} \overline{(y,0,2t)}_0 & t \leq 1/2 \\ \overline{(y,0,2t-1)}_1 & t \geq 1/2 \end{cases} \\ &\overline{(x,s,t)} \mapsto \begin{cases} \overline{(x,2s,2t)}_0 \in \Sigma C_{f_0} & s \leq 1/2, t \leq 1/2 \\ \overline{(x,2s-1,2t)}_0 \in \Sigma^2 X_0 & s \geq 1/2, t \leq 1/2 \\ \overline{(x,2s,2t-1)}_1 \in \Sigma C_{f_1} & s \leq 1/2, t \geq 1/2 \\ \overline{(x,2s-1,2t-1)}_1 \in \Sigma^2 X_1 & s \geq 1/2, t \geq 1/2 \end{cases} \end{split}$$

Final step:

$$g \cdot h = (g \star 1) \cdot (1 \star h) = (g \cdot 1) \star (1 \cdot h)$$
$$= (1 \cdot g) \star (h \cdot 1) = (1 \star h) \cdot (g \star 1) = h \cdot g$$

**Lemma 5.8.** Assume X, Y, Z are path-connected and well-pointed. (dual version of lemma 5.7.)

$$\cdots \to [Z,\Omega X]_* \xrightarrow{\Omega f_*} [Z,\Omega Y]_* \xrightarrow{j_*} [Z,P_f]_* \xrightarrow{p_*} [Z,X]_* \xrightarrow{f_*} [Z,Y]_*$$

The sequence is exact (in category **Set**\*/), and we have following by exactness:

- 1.  $[Z, \Omega Y]_*$  acts from right on  $[Z, P_f]_*$ .
- 2.  $j_*: [Z, \Omega Y]_* \to [Z, P_f]_*$  is a map between right  $[Z, \Omega Y]_*$ -sets.
- 3.  $j_*([y]) = j_*([y'])$  iff exists some  $[x] \in [Z, \Omega X]_*$  such that  $[y] = \Omega f_*([x]) \cdot [y']$ .
- 4.  $p_*([z]) = p_*([z'])$  iff exists some  $[y] \in [Z, \Omega Y]_*$  such that  $[z] = [z'] \cdot [y]$ .
- 5.  $\operatorname{Im}(\Omega j_* : [Z, \Omega^2 Y]_* \to [Z, \Omega P_f]_*)$  is central subgroup of  $[Z, \Omega P_f]_*$ .

## A Long Proofs

#### A.1 Proof of Dold-Thom Theorem

## A.2 Proof of Homotopy Excision Theorem

**Proof.** Follow notations in the statement of the theorem. Define (pointed) the triad homotopy group for  $q \ge 2$ :

$$\pi_q(X; A, B) := \pi_{q-1}(P_{i_{B,X}}, P_{i_{C,A}})$$

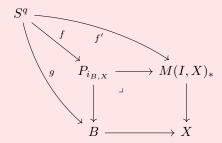

where  $i_{B,X}: B \hookrightarrow X$ ,  $i_{C,A}: C \hookrightarrow A$  and  $P_f$  is the homotopy fiber

$$\{(y,\gamma) \in Y \times M(I,Z)_* \mid \gamma(1) = f(y)\}$$

of pointed map  $f: Y \to Z$ . Use long exact sequence of pairs:

$$\cdots \to \pi_q(P_{i_{B,X}}, P_{i_{C,A}}) \to \pi_{q-1}(P_{i_{C,A}}) \to \pi_{q-1}(P_{i_{B,X}}) \to \pi_{q-1}(P_{i_{B,X}}, P_{i_{C,A}}) \to \pi_{q-2}(P_{i_{C,A}}) \to \cdots \\ \cdots \to \pi_1(P_{i_{B,X}}, P_{i_{C,A}}) \to \pi_0(P_{i_{C,A}}) \to \pi_0(P_{i_{B,X}})$$

and observe that  $\pi_q(P_{i_{X,B}}) \cong \pi_{q+1}(X,B)$  since for any  $f: S^q \to P_{i_{X,B}}$  we have:

use the fact  $f' \in M(S^q, M(I, X)_*)_* \cong M(S^q \wedge I, X)_* \ni f''$  and  $S^q \wedge I \approx D^{q+1}$  with

$$S^q \hookrightarrow S^q \wedge I \approx D^{q+1}$$
  
 $s \mapsto (s,1)$ 

the condition f'(s)(1) = g(s) is equivalent to f''((s,1)) = g(s), that is have a map f is equivalent to have a map  $f'': (D^{q+1}, S^q) \to (X, B)$ . With the analogue statement also valid for homotopies  $S^q \times I \to P_{i_{X,B}}$ , we have  $\pi_q(P_{i_{B,X}}) = [S^q, *; P_{i_{B,X}}, *] \cong [D^{q+1}, S^q; X, B] = \pi_{q+1}(X, B)$ . Rewrites the long exact sequence of pairs above to:

$$\cdots \to \pi_{q+1}(X; A, B) \to \pi_q(A, C) \to \pi_q(X; B) \to \pi_q(X; A, B) \to \pi_{q-1}(A, C) \to \cdots$$
$$\cdots \to \pi_2(X; A, B) \to \pi_1(A, C) \to \pi_1(X, B)$$

Conditions  $m \geq 1$ ,  $n \geq 1$  guarantees  $\pi_0(C) \to \pi_0(A)$  and  $\pi_0(C) \to \pi_0(B)$  are surjections.  $m \geq 2$  is equivalent to  $\pi_1(A,C) = 0$ , which implies  $\pi_0(C) \to \pi_0(A)$  is bijection. For  $x \in \pi_0(A \cap_C B)$ , we can always find  $b \in \pi_0(B), i_{B,X}|_*(b) = x$  or  $a \in \pi_0(A), i_{A,X}|_*(a) = x$  which becomes  $b \in \pi_0(B), i_{B,X}|_*(b) = x$  or  $c \in \pi_0(C), i_{C,X}|_*(c) = x$  when  $\pi_0(C) \to \pi_0(A)$  is bijection. That is equivalent to  $\pi_0(B) \to \pi_0(X)$  is bijection, which means  $\pi_1(X,B) = 0$ .

We only need to show that for  $2 \le q \le m + n - 2$ ,  $\pi_q(X; A, B) = 0$ .

With  $J^{q-1} := (\partial I^{q-1} \times I) \cup (I^{q-1} \times \{0\})$ , we have:

$$\begin{split} \pi_q(P_{i_{B,X}},P_{i_{C,A}}) &= [I^q,\partial I^q,J^{q-1};P_{i_{B,X}},P_{i_{C,A}},*] \\ &= [I^q \wedge I;\ I^q,\ \partial I^q \wedge I,\ J^{q-1} \wedge I \to X;B,A,*] \\ &:= \text{relative homotopy classes of pointed maps} \end{split}$$

$$f: I^q \wedge I \to X \text{ satisfying:} egin{array}{ll} f(I^q) &\subseteq B \\ f(\partial I^q \wedge I) &\subseteq A \\ f(\partial I^q) &\subseteq C \\ f(J^{q-1} \wedge I) &= * \end{array}$$

"relative" means the homotopy h determine the classes

satisfy: 
$$\begin{cases} h(I^{q} \times I) & \subseteq B \\ h((\partial I^{q} \wedge I) \times I) & \subseteq A \\ h(\partial I^{q} \times I) & \subseteq C \\ h((J^{q-1} \wedge I) \times I) & = * \end{cases}$$

(notice that  $\partial I^q \wedge I \cap I^q = \partial I^q$ , therefore  $f(\partial I^q) \subseteq A \cap B = C$ ) (this is called (relative) homotopy class of maps of tetrads)

$$= [(I^{q} \times I)/K; \ I^{q} \times \{1\}, \ (\partial I^{q} \times I)/K, \ (J^{q-1} \times I)/K \to X; B, A, *]$$

$$(K := I^{q} \times \{0\} \cup \{i_{0}\} \times I)$$

$$= [I^{q+1}; \ (I^{q} \times \{1\}) \cup K, \ (\partial I^{q} \times I) \cup K, \ J^{q-1} \times I \cup K \to X; B, A, *]$$

$$= [I^{q+1}; \ I^{q} \times \{1\}, \ I^{q-1} \times \{1\} \times I, \ J^{q-1} \times I \cup I^{q} \times \{0\} \to X; B, A, *]$$

$$(\text{notice that } \partial I^{q} = \partial I^{q-1} \times I \cup I^{q-1} \times \{0, 1\})$$

We can assume that (A,C) have no relative q < m-cells and (B,C) have no relative q < m-cells. And we can assume that X has finite many cells since  $I^q$  is compact. For subcomplexes  $C \subseteq A' \subseteq A$ , where  $A = e^m \cup A'$  (attaching one cell from A'). Let  $X' := A' \cup_C B$ , if the results hold for (X'; A', B) and (X; A, X'), then it hold for (X; A, B) since we have map between exact homotopy sequences of triples (A, A', C) and (X, X', B):

$$\pi_{q+1}(A, A') \longrightarrow \pi_{q}(A', C) \longrightarrow \pi_{q}(A, C) \longrightarrow \pi_{q}(A, A') \longrightarrow \pi_{q-1}(A', C)$$

$$\downarrow i_{1,q+1} \downarrow \qquad \qquad \downarrow i_{1,q} \downarrow \qquad \qquad \downarrow i_{1,q-1} \downarrow$$

$$\pi_{q+1}(X, X') \longrightarrow \pi_{q}(X', B) \longrightarrow \pi_{q}(X, B) \longrightarrow \pi_{q}(X, X') \longrightarrow \pi_{q-1}(X', B)$$

induced by inclusion  $(A, A', C) \hookrightarrow (X, X', B)$ . If the result hold for (X'; A', B) and (X; A, X'), maps  $i_{1,q}$ ,  $i_{2,q}$  are isomorphisms when  $1 \ge q \ge m + n - 3$ , are epimorphisms when q = m + n - 2. Notice the 5-lemma says that

if  $i_{1,q}$  and  $i_{2,q}$  are epimorphisms,  $i_{1,q-1}$  are monomorphism, then  $i_{3,q}$  is epimorphism. if  $i_{1,q}$  and  $i_{2,q}$  are monomorphisms,  $i_{2,q+1}$  are epimorphism, then  $i_{3,q}$  is monomorphism. We also have if  $C\subseteq B'\subseteq B$  with  $B=B'\cup e^n$ , the result hold for CW-triads (X';A,B') and (X;X',B) where  $X'=A\cup_C B'$ , since  $(A,C)\hookrightarrow (X,B)$  factors as  $(A,C)\hookrightarrow (X',B')\hookrightarrow (X,B)$ .

Now we can assume that  $A = C \cup D^m$  and  $B = C \cup D^n$ .

The current goal of proof is to prove any

$$f: (I^{q+1}; I^q \times \{1\}, I^{q-1} \times \{1\} \times I, J^{q-1} \times I \cup I^q \times \{0\}) \to (X; B, A, *)$$

is nullhomotopic for any q+1 with  $2 \le q+1 \le m+n-2$ .

For  $a \in \stackrel{\circ}{D^m}$ ,  $b \in \stackrel{\circ}{D^n}$  We have inclusions of based triads:

$$(A; A, A - \{a\}) \hookrightarrow (X - \{b\}; X - \{b\}, X - \{a, b\}) \hookrightarrow (X; X - \{b\}, X - \{a\}) \hookleftarrow (X; A, B)$$

The first and the third induces isomorphisms on homotopy groups of triads since B is a strong deformation retract of  $X - \{a\}$  in X and A is a strong deformation retract of  $X - \{b\}$  in X.  $\pi_*(A; A, A - \{a\}) = 0$  since  $\pi_*(A, A - \{a\}) \to \pi_*(A, A \cap \{a\})$  are isomorphisms.

Current goal : choose good a, b to show f regarded as a pointed traid map to  $(X; X - \{b\}, X - \{a\})$  is homotopic to a map

$$f': (I^{q+1};\ I^{q-1} \times \{1\} \times I,\ I^q \times \{1\},\ J^{q-1} \times I \cup I^q \times \{0\}) \to (X - \{b\}; X - \{b\}, X - \{a, b\}, *)$$
 if  $2 \le q+1 \le m+n-2$ .

Note. We want to homotopically remove some point  $f^{-1}(b)$ , first we may want to construct some Uryssohn function u separating  $f^{-1}(a) \cup J^{q-1} \times I \cup I^q \times \{0\}$  and  $f^{-1}(b)$  and construct homotopy of cube  $h^+: (r,s,t) \mapsto (r,(1-u(r,s)t)s)$  wishing that  $f(h^+(r,s,1))$  would miss b. The problem in this method is that points  $f^{-1}(b)$  in the cube would be homotopically replaced by other points. Since our desire homotopy does not change the first q coordinates of the cube, we want to separate  $p^{-1}(p(f^{-1}(a))) \cup J^{q-1} \times I$  and  $p^{-1}(p(f^{-1}(b)))$  (where  $p: I^q \times I \to I^q$ ). Our problem is to find suitable a, b such that  $p(f^{-1}(a)) \cap p(f^{-1}(b)) = \emptyset$ .

We use manifold structure on  $D^m$  and  $D^n$  to achieve it, now we homotopically approximate f by a map g which smooth on  $f^{-1}(D^m_{<1/2} \cup D^n_{<1/2})$ .

Let  $U_{< r} := f^{-1}(D^m_{< r} \cup D^n_{< r})$ , Use smooth deformation theorem to construct smooth map (for any  $0 < \epsilon$ )  $g' : U_{<3/4} \to D^m_{<3/4} \cup D^n_{<3/4}$  with homotopy  $h_1 : g' \simeq f|_{U_{<3/4}}$  (and bound  $|g'(x) - f(x)| < \epsilon$  for any  $x \in U_{<1}$ ) and take partition of unity  $\{\rho, \rho'\}$  with subcoordinates  $\{I^{q+1} - \overline{U_{<1/2}}, U_{<3/4}\}$ , we have:

$$g := \rho f + \rho' g'$$

$$h_2 : g \simeq f \operatorname{rel} (I^{q+1} - U_{<3/4})$$

$$h_2 : I^{q+1} \times I \to X$$

$$(x,t) \mapsto \rho(x) f(x) + \rho'(x) h_1(x,t)$$

with scalar multiplication and addition is already defined on smooth structure on  $D^m_{<3/4} \cup D^n_{<3/4}$ . We could assume that  $g(I^{q-1} \times \{1\} \times I) \cap D^n_{<1/2} = \emptyset$  (which implies g is a map of tetrads to  $(X; X - \{b\}, X - \{a\}, *)$ ) and  $g(I^q \times \{1\}) \cap D^m_{<1/2} = \emptyset$  since  $f(I^{q-1} \times \{1\} \times I) \subseteq A$  and  $f(I^q \times \{1\}) \subseteq B$  and we can always tighten the bound  $\epsilon$ , (Similar argument also hold for  $h_2$ , then we have  $h_2: g \simeq f$  as homotopy between maps of tetrads.)

Use the manifold structure to find good (a,b):  $V:=g^{-1}(D^m_{<1/2})\times g^{-1}(D^n_{<1/2})$  is a sub-manifold of  $I^{2(q+1)}$ . Consider  $W:=\{(v,v')\in V\mid p(v)=p(v')\}$ , which is the zero set of smooth submersion  $(v,v')\mapsto p(v)-p(v')$ . W is smooth manifold with codimension q. Therefore the map  $(g,g):W\to D^m_{<1/2}\times D^n_{<1/2}$  is smooth map between manifolds of dimension q+2 and m+n. The map is not surjection since q+2< m+n. Then we have  $(a,b)\notin (g,g)(W)$  (that is,  $p(g^{-1}(a))\cap p(g^{-1}(b))$ ).

Since  $g(I^{q-1} \times \{1\} \times I) \cap D^n_{<1/2} = \emptyset$  and  $g(J^{q-1} \times I) \cap D^n_{<1/2} = \emptyset$ , we have  $g(\partial I^q \times I) \cap D^n_{<1/2} = \emptyset$ . By Uryssohn's lemma, we have  $u: I^q \to I$  separating  $p(g^{-1}(a)) \cup \partial I^q$  and  $p(g^{-1}(b))$ . Finally we have:

$$h': I^q \times I \times I \to I^q \times I$$
  
 $(r, s, t) \mapsto (r, (1 - u(r)t)s)$ 

and  $h:=g\circ h',\ f':=h(-,1).\ f'(I^{q+1})\cap\{b\}=\emptyset$  since if  $\exists (r,s)\in I^q\times I,\ f'(r,s)=b,$  then b=g(r,(1-u(r))s)=g(r,0)=\* leads to contradiction. Last step is to check that h is a homotopy between maps

$$(I^{q+1};\ I^{q-1}\times\{1\}\times I,\ I^{q}\times\{1\},\ J^{q-1}\times I\cup I^{q}\times\{0\})\to (X;X-\{b\},X-\{a\},*)$$

Since g is,  $g \circ h'$  is too.
